## Example 12:

Write an Algorithm to find the factorial of $\mathbf{N}$ where $\mathbf{N}$ is any Positive number.
$\mathrm{N}!=1 * 2 * 3 * 4 * 5$ $\qquad$

Solution:
1- Start.
2- Read the value of N .
3- Let the initial value of the factorial $(\mathrm{F})$ equals to one $(\mathrm{F}=1)$.
4 - Let the initial value of the counter equals to zero ( $\mathrm{I}=0$ ).
5 - Increase the value of the counter by one ( $\mathrm{I}=\mathrm{I}+1$ ).
$6-\mathrm{F}=\mathrm{F} * \mathrm{I}$
7- If the counter (I) is less than N return to step 5.
8- Print F.
9-End

The flowchart of example 12 is shown below:

Example 13: Write an Algorithm to evaluate the following equation:

$$
Y=\frac{1}{A}+\frac{1+2}{2 A}+\frac{1+2+3}{3 A}+\frac{1+2+3+4}{4 A} \ldots \ldots \ldots . N \text { Tearms }
$$

Where: A is a variable.

Solution:
1- Start
2- Read A, N
3- $\mathrm{Y}=0, \mathrm{I}=0, \mathrm{~S}=0$
4-I=I+1
5-S=S+I
6- $\mathrm{Y}=\mathrm{Y}+\frac{s}{A * I}$
7- If $\mathrm{I}<\mathrm{N}$ go to step 4
8- Print the value of Y
9- End

The flowchart of example 13 is:
