Chapter (5) Capacitors and Inductors

Capacitors :

A circuit element that is composed of two conducting plates or surfaces separated by a dielectric (non conducting) materials

Let A : surface area of each plate d : distance between the two plates

It is found that

$$C = \frac{\varepsilon_0 A}{d}$$

Where :

 $\varepsilon_0 \equiv$ Permittivity of free space

$$\varepsilon_0 \equiv 8.85 * 10^{-12} F/m$$

• If a voltage source (v) is connected to the capacitor , +ve charge will be transferred to one plate while –ve charge will be transferred to the other plate.

Let the charge stored at the capacitor $\equiv q$

If
$$v \mid q \mid$$

 $\therefore \quad v \propto q$

It has been found that

q = c v

C is the capacitance

$$\Rightarrow c = \frac{q}{v}$$

Current in capacitor :

We know that

$$i(t) = \frac{dq(t)}{dt}$$

$$\therefore \quad i_{c}(t) = \frac{d}{dt} (c v_{c}(t))$$

$$\Rightarrow i_{c}(t) = C \frac{dv_{c}(t)}{dt}$$

Voltage of capacitors

$$\therefore \quad i_{c}(t) = C \frac{dv_{c}(t)}{dt}$$
$$\therefore \quad i_{c}(t) dt = C dv_{c}(t)$$
$$\Rightarrow dv_{c}(t) = \frac{1}{C} i_{c}(t) dt$$

$$v_{c}(t) = v_{c}(t_{0}) + \frac{1}{C} \int_{\tau=t_{0}}^{\tau=t} i_{c}(\tau) d\tau$$

Where t_0 : initial time

Power of the capacitors :

$$P_{c}(t) = v_{c}(t)i_{c}(t)$$

$$P_{c}(t) = v_{c}(t)C\frac{dv_{c}(t)}{dt} = C v_{c}(t)\frac{dv_{c}(t)}{dt}$$

or

$$P_{c}(t) = i_{c}(t) \left[v_{c}(t_{0}) + \frac{1}{C} \int_{\tau=t_{0}}^{\tau=t} i_{c}(\tau) d\tau \right]$$

$$\frac{\text{Energy of capacitor}}{W_{c}(t)} = \int_{\tau=-\infty}^{\tau=t} P_{c}(\tau) d\tau$$

$$= \int_{\tau=-\infty}^{\tau=t} \left(C V_{c}(\tau) \frac{dV_{c}(\tau)}{d\tau} \right) d\tau$$

$$= \int_{v_{c}(\tau)}^{v_{c}(t)} V_{c}(\tau) dV_{c}(\tau)$$

$$= \frac{1}{2} C V_{c}^{2}(\tau) \Big|_{v_{c}(\tau=0)}^{v_{c}(t)}$$

$$= \frac{1}{2} C V_{c}^{2}(t) - \frac{1}{2} C V_{c}^{2}(-\infty)$$

Assuming

•

$$v_{c}(-\infty) = 0$$
$$w_{c}(t) = \frac{1}{2} C v_{c}^{2}(t)$$

$$v_{c}(t) = \frac{q(t)}{C}$$

$$\therefore \quad w_{c}(t) = \frac{1}{2}C\frac{q^{2}(t)}{C^{2}}$$

$$w_{c}(t) = \frac{1}{2C}q^{2}(t)$$

Example:

The following voltage is imposed across the terminals of a 0.5 μF capacitor.

$$v_{c}(t) = \begin{cases} 0 \quad V \quad , \quad t \leq 0 \\ 4t \quad V \quad , \quad 0 \leq t \leq 1 \\ 4e^{-(t-1)} \quad V, \quad 1 \leq t < \infty \end{cases}$$

Find the following:
1.
$$i_c(t)$$

2. $P_c(t)$
3. $w_c(t)$
(1) $i_c(t) = C \frac{dv_c(t)}{dt}$
 $\therefore i_c(t) = \begin{cases} 0 & t \langle 0 \\ C \frac{d}{dt} (4t) = 4C = 2 \mu A & 0 \langle t \langle 1 \\ C \frac{d}{dt} [4e^{-(t-1)}] = (4C)(-1)e^{-(t-1)} = -2e^{-(t-1)}\mu A & 1 \langle t \langle \infty \rangle \end{cases}$

$$2 \mu A$$

$$2 \mu A$$

$$-2 \mu A$$

$$-2$$

Example :

The voltage at the terminals of a 0.5 μ F capacitor is

$$v_{c}(t) = \begin{cases} 0 & t \le 0\\ 100 e^{-20000t} \sin(40000 t) & V & t \ge 0 \end{cases}$$

Find:

- 1. i(0)
- 2. Power delivered to the capacitors at $t = \Pi/80$ m S.
- 3. Energy stored in the capacitor at $t = \Pi/80$ m S

$$i(t) = C \frac{dv_{c}(t)}{dt}$$

$$= C \frac{d}{dt} \Big[100 \ e^{-20,000^{t}} \sin(40,000 \ t) \Big]$$

= C $\Big[100 \ e^{-20,000t} \cos(40,000 \ t)(40,000) + \sin(40,000 \ t)(-2*10^{6} \ e^{-20,000t}) \Big]$
 $i_{c}(0) = 0.5*10^{-6} \Big[100 \ (1) \ (1) \ (40,000) + 0 \Big]$
 $i_{c}(0) = 2 \ A$
 $(2) \ Find \ P_{c} \Big(\frac{\Pi}{80} \ m \Big) \qquad ?$
 $P_{c}(t) = C \ v_{c}(t) \frac{dv_{c}(t)}{dt} , t \ge 0$
 $= (0.5 \mu \ F) \Big(100 \ e^{-20,000t} \sin(40,000 \ t) \Big)$
 $* \Big[100 \ e^{-20,000t} \cos(40,000 \ t) \ (40,000) + \sin(40,000 \ t) \ (-2*10^{6} \ e^{-20,000t}) \Big]$

$$P_{\rm C} \left(\frac{\Pi}{80} \,\mathrm{m}\right) = -20.79 \,\mathrm{W}$$
 (discharging)

(3) Find
$$W_C \left(\frac{\Pi}{80}m\right)$$
 ?
 $W_C(t) = \frac{1}{2} C v_C^2(t) = \frac{1}{2} C \left[100e^{-20,000t} \sin(40,000t)\right]^2$
 $W_C \left(\frac{\Pi}{80}m\right) = 519.2 \,\mu J$

Inductors :

Inductors are circuit elements that consist of a conducting wire in the shape of a coil

• If a current is flowing in the inductor, it produce a magnetic field Φ .

$$\Phi(t) = \mathrm{Li}(t)$$

Where L is the inductance and measured in Henry [H]

- The direction of (Φ) depends on the right-hand rule.
 As the current increases or decreases, the magnetic field spreads or collapse
- •The change in magnetic field induces a voltage across the inductor. $d\Phi(t)$

$$V_{L}(t) = \frac{d\Phi(t)}{dt}$$
$$\therefore V_{L}(t) = L \frac{di_{L}(t)}{dt}$$

Current in inductors :

$$v_{L}(t) = L \frac{di_{L}(t)}{dt}$$
$$di_{L}(t) = \frac{1}{L} v_{L}(t) dt$$

Integrate both sides as before

$$i_{L}(t) = i_{L}(t_{0}) + \frac{1}{L} \int_{\tau=t_{0}}^{\tau=t} v(\tau) d\tau$$

 $v(t) = -L \frac{di(t)}{dt}$

$$v(t) = L \frac{di(t)}{dt}$$

Power in inductor :

$$P_{L}(t) = v_{L}(t)i_{L}(t)$$
$$= i_{L}(t)\left[L\frac{di_{L}(t)}{dt}\right]$$
$$P_{L}(t) = Li_{L}(t)\frac{di_{L}(t)}{dt}$$
$$P_{L}(t) = v_{L}(t)\left[i_{L}(t_{0}) + \frac{1}{L}\int_{\tau=t_{0}}^{\tau=t}v(\tau)d\tau\right]$$

Energy in inductors:

$$w_{L}(t) = \int_{\tau=-\infty}^{\tau=t} P_{L}(\tau) d\tau$$
$$= \int_{\tau=-\infty}^{\tau=t} L i_{L}(\tau) \frac{di_{L}(\tau)}{d\tau} d\tau$$

As before

$$w_{L}(t) = \frac{1}{2} L i_{L}^{2}(t)$$

Example :

The current flow through an 100 m H inductor

$$i_{L}(t) = \begin{cases} 0 & A & t \le 0 \\ 10 & t e^{-5t} & A & t \ge 0 \end{cases}$$

Find :

$$i_{Lmax} = i_L (0.2) = 10 (0.2) e^{-5(0.2)}$$

= 2 e⁻¹ = 0.736 A

(2)
$$v_L(t) = L \frac{di_L(t)}{dt}$$

= $(0.1 \text{ H}) \frac{d}{dt} [10 \text{ t e}^{-5t}]$
= $(0.1) \text{ e}^{-5t} (-50 \text{ t} + 10)$
= $\text{e}^{-5t} (1-5 \text{ t})$

$$v_{L}(t) = \begin{cases} 0 & , t < 0 \\ e^{-5t} (1-5t) & , t > 0 \end{cases}$$

(3)
$$P_{L}(t) ?$$

 $P_{L}(t) = L i_{L}(t) \frac{di_{L}(t)}{dt}$
 $P_{L}(t) = 0 , t \le 0$
 $P_{L}(t) = (0.1)(10 t e^{-5t})[e^{-5t}(-50 t + 10)] , t \ge 0$
 $P_{L}(t) = t e^{-10t}(10 - 50 t)$
 $P_{L}(t) = \begin{cases} 0 , t \le 0 \\ 10 t e^{-10t}(1 - 5 t) , t \ge 0 \end{cases}$

(4)
$$w_{L}(t)$$
 ?
 $w_{L}(t) = \frac{1}{2} L i_{L}^{2}(t)$
 $=\begin{cases} 0, & t \le 0 \\ \frac{1}{2} (0.1) (10 t e^{-5t})^{2} = 5 t^{2} e^{-10t} , t \ge 0 \end{cases}$

Summary of results :

| | Capacitor | Inductor |
|--------------|---|--|
| | | |
| v (t) | $\mathbf{v}_{\mathrm{C}}(\mathbf{t}_{0}) + \frac{1}{c} \int_{\tau=t_{0}}^{\tau=t} \mathbf{i}_{c}(\tau) d\tau$ | $L \frac{di_{L}(t)}{dt}$ |
| i (t) | $c \frac{d v_{c}(t)}{dt}$ | $i_{L}(t_{0}) + \frac{1}{L}\int_{\tau=t_{0}}^{\tau=t} v_{L}(\tau) d\tau$ |
| P (t) | $c v_{c}(t) \frac{dv_{c}(t)}{dt}$ | $L i_{L}(t) \frac{di_{L}(t)}{dt}$ |
| w (t) | $\frac{1}{2} c v_{c}^{2}(t)$ | $\frac{1}{2} \operatorname{L} i_{L}^{2} (t)$ |

- 1. If $v_{C}(t) = constant$, $i_{C}(t) = 0$
 - Capacitor will be open circuit
- 2. $v_{C}(t)$ cannot change instantaneously (no sudden change)

because
$$\int_{\tau=t_0}^{\tau=t} i_C(\tau) d\tau = 0$$

3. Capacitors can store energy

$$w_{c}(t) = \frac{1}{2}c v_{c}^{2}(t)$$

- 1. If $i_L(t) = \text{constant}$, $v_L(t) = 0$
 - Inductor will be short circuit
- 2. $i_L(t)$ cannot change instantaneously (no sudden change)

because
$$\int_{\tau=t_0}^{\tau=t} v_L(\tau) d\tau = 0$$

3. Inductors can store energy

$$w_{L}(t) = \frac{1}{2}L i_{L}^{2}(t)$$

Capacitors and Inductors combinations :

1. Series capacitors :

$$v(t) = v_1(t) + v_2(t) + v_3(t) + \dots + v_N(t)$$

For each capacitor,

$$v_{k}(t) = v_{k}(t_{0}) + \frac{1}{c_{k}} \int_{\tau=t0}^{\tau=t} i(\tau) d\tau$$
$$v(t) = v_{1} + v_{2} + \dots + v_{N}$$
$$v(t) = \left[\sum_{k=1}^{N} v_{k}(t_{0})\right] + \left(\sum_{k=1}^{N} \frac{1}{c_{k}}\right) \int_{\tau=t_{0}}^{\tau=t} i(\tau) d\tau$$

The equivalent capacitance C_S is

$$\frac{1}{C_{S}} = \sum_{k=1}^{N} \frac{1}{C_{k}} = \frac{1}{C_{1}} + \frac{1}{C_{2}} + \dots + \frac{1}{C_{N}}$$

Parallel capacitors :

$$C_{P} = C_{1} + C_{2} + C_{3} + \dots + C_{N}$$

Parallel Inductors :

$$i(t) = i_1(t) + i_2(t) + \dots + i_N(t)$$

where $i_{k}(t) = i_{k}(t_{0}) + \frac{1}{L_{k}} \int_{\tau=t_{0}}^{\tau=t} v(\tau) d\tau$

$$i(t) = \left[\sum_{k=1}^{N} i_k(t_0)\right] + \left[\sum_{k=1}^{N} \frac{1}{L_k}\right] \int_{\tau=t_0}^{\tau=t} v(\tau) d\tau$$
$$i(t) = i(t_0) + \frac{1}{L_p} \int_{\tau=t_0}^{\tau=t} v(\tau) d\tau$$

The equivalent inductance , L_P

Example:

Find the equivalent inductance with respect to the terminals a ,b?

• $L_{89} = L_8$ in parallel with L_9 $\therefore L_{89} = \frac{L8 L9}{L8 + L9} = 9.6 H$ • $L_{589} = L_5$ in series with L_{89}

$$L_{589} = L_5 + L_{89} = 10.4 + 9.6 = 20 H$$

•
$$L_{6589} = L_6$$
 in parallel with L_{589}

$$L_{6589} = \frac{L_6 L_{589}}{L_6 + L_{589}} = 12 \text{ H}$$

•
$$L_{76589} = L_7$$
 in series with L_{6589}
 $L_{76589} = L_7 + L_{6589} = 8 + 12 = 20$ H

•
$$L_{476589} = L_4$$
 in parallel with L_{76589}
 $L_{476589} = \frac{L_4 \ L_{76589}}{L_4 + L_{76589}} = 4 \text{ H}$

• $L_{3476589} = L_3$ in series with L_{476589}

$$L_{3476589} = L_3 + L_{346589} = 6 + 4 = 10 \text{ H}$$

• $L_{23476589} = L_2$ in parallel with $L_{3476589}$

$$L_{23476589} = \frac{L_2 L_{3476589}}{L_2 + L_{3476589}} = 6 H$$

• $L_{ab} = L_1$ in series with $L_{23476589}$

$$L_{ab} = L_1 + L_{2346589} = 2 + 6 = 8 H$$

Example :

Find the equivalent capacitance at the terminals a and b?

• $C_{67} = C_6$ in series with C_7 $C_{67} = \frac{C_6 C_7}{C_6 + C_7} = 12 \ \mu F$

•
$$C_{567} = C_5$$
 in parallel with C_{67}
 $C_{567} = C_5 + C_{67} = (3 + 12) \mu F = 15 \mu F$
• $C_{4567} = C_4$ in series with C_{567}
 $C_{4567} = \frac{C_4 C_{567}}{C_4 + C_{567}} = 10 \mu F$
• $C_{34567} = C_3$ in parallel with C_{4567}

$$C_{34567} = C_3 + C_{4567} = (10 + 10)\mu F = 20 \mu F$$

• $C_{ab} = C_1$ in series with C_{34567} in series with C_2

$$\frac{1}{C_{ab}} = \frac{1}{C_1} + \frac{1}{C_{34567}} + \frac{1}{C_2} = \frac{1}{5\mu} + \frac{1}{20\mu} + \frac{1}{4\mu}$$

$$\Rightarrow \qquad C_{ab} = 2\mu F$$

• $L_{24} = L_2$ in parallel with L_4 $L_{24} = \frac{L_2 \ L_4}{L_2 + L_4} = 2 \text{ m H}$

•
$$L_{124} = L_1$$
 in series with L_{24}

$$L_{124} = L_1 + L_{24} = (4 + 2) \text{ m H} = 6 \text{ m H}$$

•
$$L_{1245} = L_{124}$$
 in parallel with L_5
 $I_{1245} = \frac{L_{124} L_5}{L_{124} L_5} = 2.4 \text{ m H}$

$$L_{1245} = \frac{124}{L_{124}} = 2.4 \text{ m H}$$

•
$$L_{124536} = L_{1245}$$
 in series with L_{36}

$$L_{124536} = L_{1245} + L_{36} = (2.4 + 2) \text{ m H}$$

 $L_{124536} = 4.4 \text{ m H}$

Example :

Find the equivalent inductance at a , b if all L are 6 m H

 $L_{123} = L_{12}$ in parallel with L_3 $L_{123} = \frac{L_{12} L_3}{L_{12} + L_3} = \frac{(3)(6)}{(3) + (6)}$ m H = 2 m H

 $L_{1234} = L_{123}$ in series with L_4 $L_{1234} = L_{123} + L_4 = 2 + 6 = 8 \text{ m H}$ $L_{12345} = L_{1234}$ in parallel with L_5

$$L_{12345} = \frac{L_{1234} L_5}{L_{1234} + L5} = \frac{(8)(6)}{(8) + (6)} m H = 3.42 m H$$

$$L_{ab} = L_6$$
 in series with L_{12345}

$$L_{ab} = L_6 + L_{12345}$$

= 6 + 3.429 m H = 9.429 m H

Example:

Find the equivalent capacitance w.r.t. a, b if all C's are 4 μ F

 $C_{45} = C_4$ in parallel with C_5 = $C_4 + C_5 = 8 \mu F$

 $C_{23} = C_2$ in parallel with C_3 = $C_2 + C_3 = 8 \mu F$

$$C_{123} = C_1 \text{ in series with } C_{23}$$
$$C_{123} = \frac{C_1 C_{23}}{C_1 + C_{23}} = \frac{(4)(8)}{4+8} \,\mu \,F = \frac{32}{12} \,\mu \,F = \frac{8}{3} \,\mu \,F$$

 $C_{ab} = C_{123}$ in parallel with C₄₅

$$C_{ab} = C_{123} + C_{45} = \frac{8}{3} \mu F + 8\mu F = \frac{8 + 24}{3} \mu F$$
$$= \frac{32}{3} \mu F$$

Example :

Find the equivalent capacitance w.r.t a, b?

 $C_{23} = C_2$ in parallel with C_3 = $C_2 + C_3 = 6 \mu F$

$$C_{235} = C_{23}$$
 in series with C_5
 $C_{235} = \frac{C_{23} C_5}{C_{23} + C_5} = \frac{(6)(3)}{6+3} \mu F = 2 \mu F$

 $C_{2356} = C_{235}$ in parallel with C_6 = $C_{235} + C_6 = (2+2) \mu F = 4 \mu F$

 $C_{ab} = C_1$ in series with C_{2356} in series with C_4

$$\frac{1}{C_{ab}} = \frac{1}{C_1} + \frac{1}{C_{2356}} + \frac{1}{C_4} = \frac{1}{3\mu} + \frac{1}{4\mu} + \frac{1}{12\mu}$$

 $C_{ab} = 1.5 \ \mu F$
