## 1. Construction of Rational Numbers

Consider the set

$$V = \{(r, s) \in \mathbb{Z} \times \mathbb{Z} \mid r, s \in \mathbb{Z}, s \neq 0\}$$

of pairs of integers. Let us define an equivalence relation on  $V$  by putting

$$\boxed{(r, s) L^* (t, u) \Leftrightarrow ru = st}.$$

This is an equivalence relation. (**Exercise**).

Let

$$[r, s] = \{(x, y) \in V \mid (x, y) L^* (r, s)\},$$

denote the equivalence class of  $(r, s)$  and write  $[r, s] = \frac{r}{s}$ . Such an equivalence class  $[r, s]$  is called a **rational number**.

### Example 3.1.1.

$$(2, 12) L^* (1, 6) \text{ since } 2 \cdot 6 = 12 \cdot 1,$$

$$(2, 12) \not L^* (1, 7) \text{ since } 2 \cdot 7 \neq 12 \cdot 1.$$

$$\begin{aligned} [0, 1] &= \{(x, y) \in V \mid 0y = x1\} = \{(x, y) \in V \mid 0 = x\} = \{(0, y) \in V \mid y \in \mathbb{Z}\} \\ &= \{(0, \pm 1), (0, \pm 2), \dots\}. \end{aligned}$$

### Definition 3.1.2. (Rational Numbers)

The set of all equivalence classes  $[r, s]$  (rational number) with  $(r, s) \in V$  is called the **set of rational numbers** and denoted by  $\mathbb{Q}$ .

### 3.1. 3. Addition and Multiplication on $\mathbb{Q}$

**Addition:**  $\oplus: \mathbb{Q} \times \mathbb{Q} \rightarrow \mathbb{Q}$ ;

$$\boxed{[r, s] \oplus [t, u] = [ru + ts, su]}, s, u \neq 0$$

**Multiplication:**  $\odot: \mathbb{Q} \times \mathbb{Q} \rightarrow \mathbb{Q}$ ;

$$\boxed{[r, s] \odot [t, u] = [rt, su]}, s, u \neq 0$$

**Remark 3.1.4.** The relation  $i: \mathbb{Z} \rightarrow \mathbb{Q}$ , defined by  $i(n) = [n, 1]$  is 1-1 function, and

$$i(n + m) = i(n) \oplus i(m),$$

$$i(n \cdot m) = i(n) \odot i(m).$$

**Theorem 3.1.5.**

- (i)  $n \oplus m = m \oplus n, \forall n, m \in \mathbb{Q}$ . (Commutative property of  $\oplus$ )  
(ii)  $(n \oplus m) \oplus c = n \oplus (m \oplus c), \forall n, m, c \in \mathbb{Q}$ . (Associative property of  $\oplus$ )  
(iii)  $n \odot m = m \odot n, \forall n, m \in \mathbb{Q}$ . (Commutative property of  $\odot$ )  
(iv)  $(n \odot m) \odot c = n \odot (m \odot c), \forall n, m, c \in \mathbb{Q}$ . (Associative property of  $\odot$ )  
(v)  $(n \oplus m) \odot c = (n \odot c) \oplus (m \odot c)$  (Distributive law of  $\odot$  on  $\oplus$ )  
(vi) **(Cancellation Law for  $\oplus$ ).**

$$m \oplus c = n \oplus c, \text{ for some } c \in \mathbb{Q} \Leftrightarrow m = n.$$

- (vii) **(Cancellation Law for  $\odot$ ).**

$$m \odot c = n \odot c, \text{ for some } c (\neq 0) \in \mathbb{Q} \Leftrightarrow m = n.$$

- (viii)  $[0,1]$  is the unique element such that  $[0,1] \oplus m = m \oplus [0,1] = m, \forall m \in \mathbb{Q}$ .

- (ix)  $[1,1]$  is the unique element such that  $[1,1] \odot m = m \odot [1,1] = m, \forall m \in \mathbb{Q}$ .

**Proof.**

- (vi) Let  $m = [m_1, m_2], n = [n_1, n_2], c = [c_1, c_2] \in \mathbb{Q}, m_i, n_i, c_i \in \mathbb{Z}, i = 1, 2$ .

$$m \oplus c = n \oplus c$$

$$\Leftrightarrow [m_1, m_2] \oplus [c_1, c_2] = [n_1, n_2] \oplus [c_1, c_2]$$

$$\Leftrightarrow [m_1 c_2 + c_1 m_2, m_2 c_2] = [n_1 c_2 + c_1 n_2, n_2 c_2]$$

$$\Leftrightarrow (m_1 c_2 + c_1 m_2, m_2 c_2) L^* (n_1 c_2 + c_1 n_2, n_2 c_2)$$

$$\Leftrightarrow (m_1 c_2 + c_1 m_2) n_2 c_2 = (n_1 c_2 + c_1 n_2) m_2 c_2$$

$$\Leftrightarrow ((m_1 n_2) c_2 + (n_2 m_2) c_1) c_2 = ((n_1 m_2) c_2 + (n_2 m_2) c_1) c_2$$

$$\Leftrightarrow (m_1 n_2) c_2 + (n_2 m_2) c_1 = (n_1 m_2) c_2 + (n_2 m_2) c_1$$

$$\Leftrightarrow (m_1 n_2) c_2 = (n_1 m_2) c_2$$

$$\Leftrightarrow (m_1 n_2) = (n_1 m_2)$$

$$\Leftrightarrow (m_1 n_2) L^* (n_1 m_2)$$

$$\Leftrightarrow [m_1, m_2] = [n_1, n_2]$$

Def. of  $\oplus$  for  $\mathbb{Q}$

$$\begin{aligned} \leftrightarrow (m_1 n_2)L^*(n_1 m_2) & \text{Def. of } L^* \\ \leftrightarrow [m_1, m_2] = [n_1, n_2] & \text{Def. of } [a, b] \end{aligned}$$

(i),(ii),(iii),(iv)(v),(viii),(ix) Exercise.

**Definition 3.1.6.**

(i) An element  $[n, m] \in \mathbb{Q}$  is said to be **positive element** if  $nm > 0$ . The set of all positive elements of  $\mathbb{Q}$  will denoted by  $\mathbb{Q}^+$ .

(ii) An element  $[n, m] \in \mathbb{Q}$  is said to be **negative element** if  $nm < 0$ . The set of all positive elements of  $\mathbb{Q}$  will denoted by  $\mathbb{Q}^-$ .

**Remark 3.1.7.** Let  $[r, s]$  be any rational number. If  $s < -1$  or  $s = -1$  we can rewrite this number as  $[-r, -s]$ ; that is,  $[r, s] = [-r, -s]$ .

**Definition 3.1.8.** Let  $[r, s], [t, u] \in \mathbb{Q}$ . We say that  $[r, s]$  **less than**  $[t, u]$  and denoted by

$$[r, s] < [t, u] \Leftrightarrow ru < st,$$

where  $s, u > 1$  or  $s, u = 1$ .

**Example 3.1.9.**

$$[2, 5], [7, -4] \in \mathbb{Q}.$$

$$\begin{aligned} [2, 5] \in \mathbb{Q}^+, \text{ since } 2 = [2, 0], 5 = [5, 0] \text{ in } \mathbb{Z} \text{ and } 2 \cdot 5 &= [2 \cdot 5 + 0 \cdot 0, 2 \cdot 0 + 5 \cdot 0] \\ &= [10, 0] = +10 > 0. \end{aligned}$$

$$\begin{aligned} [-4, 7] \in \mathbb{Q}^-, \text{ since } 7 = [7, 0], -4 = [0, 4] \text{ in } \mathbb{Z} \text{ and} \\ 7 \cdot (-4) &= [7 \cdot 0 + 0 \cdot 4, 7 \cdot 4 + 0 \cdot 0] \\ &= [0, 32] = -32 < 0. \end{aligned}$$

$$[-4, 7] < [2, 5], \text{ since } -4 \cdot 5 < 2 \cdot 7.$$

$$[7, -4] < [2, 5], \text{ since } [7, -4] = [-7, -(-4)] = [-7, 4], \text{ and } -7 \cdot 5 < 2 \cdot 4.$$

## 2. Binary Operation

**Definition 3.2.1.** Let  $A$  be a non empty set. The relation  $*$ :  $A \times A \rightarrow A$  is called a **(closure) binary operation** if  $\boxed{* (a, b) = a * b \in A, \forall a, b \in A}$ ; that is,  $*$  is function.

**Definition 3.2.2.** Let  $A$  be a non empty set and  $*, \cdot$  be binary operations on  $A$ . The pair  $(A, *)$  is called **mathematical system with one operation**, and the triple  $(A, *, \cdot)$  is called **mathematical system with two operations**.

**Definition 3.2.3.** Let  $*$  and  $\cdot$  be binary operations on a set  $A$ .

(i)  $*$  is called **commutative** if  $\boxed{a * b = b * a, \forall a, b \in A}$ .

(ii)  $*$  is called **associative** if  $\boxed{(a * b) * c = a * (b * c), \forall a, b, c \in A}$ .

(iii)  $\cdot$  is called **left distributive over  $*$**  if

$$\boxed{(a * b) \cdot c = (a \cdot c) * (b \cdot c), \forall a, b, c \in A}$$

(iv)  $\cdot$  is called **right distributive over  $*$**  if

$$\boxed{a \cdot (b * c) = (a \cdot b) * (a \cdot c), \forall a, b, c \in A}$$

**Definition 3.2.4.** Let  $*$  be a binary operation on a set  $A$ .

(i) An element  $e \in A$  is called an **identity with respect to  $*$**  if

$$\boxed{a * e = e * a = a, \forall a \in A}$$

(ii) If  $A$  has an identity element  $e$  with respect to  $*$  and  $a \in A$ , then an element  $b$  of  $A$  is said to be an **inverse of  $a$  with respect to  $*$**  if

$$\boxed{a * b = b * a = e}$$

**Example 3.2.5.** Let  $X$  be a non empty set.

(i)  $(P(X), \cup)$  formed a mathematical system with identity  $\emptyset$ .

(ii)  $(P(X), \cap)$  formed a mathematical system with identity  $X$ .

(iii)  $(\mathbb{N}, +)$  formed a mathematical system with identity 0.

(iv)  $(\mathbb{Z}, +)$  formed a mathematical system with identity 0 and  $-a$  an inverse for every  $a(\neq 0) \in \mathbb{Z}$ .

(iv)  $(\mathbb{Z} \setminus \{0\}, \cdot)$  formed a mathematical system with identity 1.

**Theorem 3.2.6.** Let  $*$  be a binary operation on a set  $A$ .

(i) If  $A$  has an identity element with respect to  $*$ , then this identity is unique.

(ii) Suppose  $A$  has an identity element  $e$  with respect to  $*$  and  $*$  is associative. Then the inverse of any element in  $A$  if exist it is unique.

**Proof.**

(i) Suppose  $e$  and  $\hat{e}$  are both identity elements of  $A$  with respect to  $*$ .

$$(1) a * e = e * a = a, \forall a \in A \quad (\text{Def. of identity})$$

And

$$(2) a * \hat{e} = \hat{e} * a = a, \forall a \in A \quad (\text{Def. of identity})$$

$$(3) \hat{e} * e = e * \hat{e} = \hat{e} \quad (\text{Since (1) is hold for } a = \hat{e} )$$

$$(4) e * \hat{e} = \hat{e} * e = e \quad (\text{Since (2) is hold for } a = e )$$

$$(5) e = \hat{e} \quad (\text{Inf. (3) and (4) )}$$

(ii) Let  $a \in A$  has two inverse elements say  $b$  and  $c$  with respect to  $*$ . To prove  $b = c$ .

$$(1) a * b = b * a = e \quad (\text{Def. of inverse (} b \text{ inverse element of } a))$$

$$(2) a * c = c * a = e \quad (\text{Def. of inverse (} c \text{ inverse element of } a))$$

$$(3) b = b * e \quad (\text{Def. of identity})$$

$$= b * (a * c) \quad (\text{From (2) Rep}(e: a * c))$$

$$= (b * a) * c \quad (\text{Since } * \text{ is associative})$$

$$= e * c \quad \text{(From (i) Rep}(b * a: e)) \text{ and}$$

$$= c \quad \text{(Def. of identity).}$$

Therefore;  $b = c$ .

**Definition 3.2.7.** A mathematical system with one operation,  $(G, *)$  is said to be

(i) **semi group** if  $\boxed{(a * b) * c = a * (b * c), \forall a, b, c \in G}$ . (Associative law)

(ii) **group** if

(1) (Associative law)  $\boxed{(a * b) * c = a * (b * c), \forall a, b, c \in G}$ .

(2) (Identity with respect to  $*$ ) There exist an element  $e$  such that  $a * e = e * a = a, \forall a \in A$ .

(3) (Inverse with respect to  $*$ ) For all  $a \in G$ , there exist an element  $b \in G$  such that  $\boxed{a * b = b * a = e}$ .

(4) If the operation  $*$  is commutative on  $G$  then the group is called **commutative group**; that is,  $\boxed{a * b = b * a, \forall a, b \in G}$ .

**Example 3.2.8.** (i) Let  $G$  be a non empty set.  $(P(G), \cup)$  and  $(P(G), \cap)$  are not group since it has no inverse elements, but they are semi groups.

(ii)  $(\mathbb{N}, +)$ ,  $(\mathbb{N}, \cdot)$  and  $(\mathbb{Z}, \cdot)$ , are not groups since they have no inverse elements, but they are semi groups.

(iii)  $(\mathbb{Z}, +)$ ,  $(\mathbb{Q} \setminus \{0\}, \cdot)$ , are commutative groups.

### Symmetric Group 3.2.9.

Let  $X = \{1,2,3\}$ , and  $S_3 =$ Set of All permutations of 3 elements of the set  $X$ .

-----	-----	-----
3	2	1

There are 6 possibilities and all possible permutations of  $X$  as follows:

1			2			3			4			5			6		
1	2	3	1	3	2	2	1	3	2	3	1	3	1	2	3	2	1

Let  $\sigma_i: X \rightarrow X, i = 1, 2, \dots, 6$ , defined as follows:

$\sigma_1(1) = 1$	$\sigma_2(1) = 2$	$\sigma_3(1) = 3$
$\sigma_1(2) = 2$	$\sigma_2(2) = 1$	$\sigma_3(2) = 2$
$\sigma_1(3) = 3$	$\sigma_2(3) = 3$	$\sigma_3(3) = 1$
$\sigma_1 = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \end{pmatrix} = ()$	$\sigma_2 = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 1 & 3 \end{pmatrix} = (12)$	$\sigma_3 = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \end{pmatrix} = (13)$
$\sigma_4(1) = 1$	$\sigma_5(1) = 2$	$\sigma_6(1) = 3$
$\sigma_4(2) = 3$	$\sigma_5(2) = 3$	$\sigma_6(2) = 1$
$\sigma_4(3) = 2$	$\sigma_5(3) = 1$	$\sigma_6(3) = 2$
$\sigma_4 = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 3 & 2 \end{pmatrix} = (23)$	$\sigma_5 = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 3 & 1 \end{pmatrix} = (123)$	$\sigma_6 = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 1 & 2 \end{pmatrix} = (132)$

$$S_3 = \{\sigma_1 = () = e, \sigma_2 = (12), \sigma_3 = (13), \sigma_4 = (23), \sigma_5 = (123), \sigma_6 = (132)\}.$$

- $X = \{ \triangle, \circ, \square \}$

- Define an arbitrary bijection

$$\sigma_4 = (23) = \begin{pmatrix} 1 & 2 & 3 \\ 1 & 3 & 2 \end{pmatrix}$$

$R_0$

$R_0 = \sigma_1$

$R_{120}$

$R_{120} = \sigma_5$

$R_{240}$

$R_{240} = \sigma_6$

Note that  $R_{240} = R_{120} \circ R_{120} = R_{120}^2$ .

Draw a vertical line through the top corner  $i$ ,  $i = 1, 2, 3$  and flip about this line.

1- If  $i = 1$  call this operation  $F = F_1$ .

2- If  $i = 2$  call this operation  $F_2$ .

3- If  $i = 3$  call this operation  $F_3$ .

Note that  $F^2 = F \circ F = \sigma_1$ , representing the fact that flipping twice does nothing.

- ❖ All permutations of a set  $X$  of 3 elements **form a group** under composition  $\circ$  of functions, called the **symmetric group** on 3 elements, denoted by  $S_3$ . (Composition of two bijections is a bijection).

$\circ$	$\sigma_1 = e$	$\sigma_2 = (12)$	$\sigma_3 = (13)$	$\sigma_4 = (23)$	$\sigma_5 = (123)$	$\sigma_6 = (132)$
$\sigma_1 = e$	$\sigma_1$	$\sigma_2$	$\sigma_3$	$\sigma_4$	$\sigma_5$	$\sigma_6$
$\sigma_2 = (12)$	$\sigma_2$	$e$	$\sigma_6$	$\sigma_5$	$\sigma_4$	$\sigma_3$
$\sigma_3 = (13)$	$\sigma_3$	$\sigma_5$	$e$	$\sigma_6$	$\sigma_2$	$\sigma_4$
$\sigma_4 = (23)$	$\sigma_4$	$\sigma_6$	$\sigma_5$	$e$	$\sigma_3$	$\sigma_2$
$\sigma_5 = (123)$	$\sigma_5$	$\sigma_3$	$\sigma_4$	$\sigma_2$	$\sigma_6$	$e$
$\sigma_6 = (132)$	$\sigma_6$	$\sigma_4$	$\sigma_2$	$\sigma_3$	$e$	$\sigma_5$

$$\sigma_2 \circ \sigma_3 = \sigma_6$$

$$\sigma_5 \circ \sigma_2 = \sigma_3$$
