

Q1) The concept of Public-Key Cryptography evolved from an attempt to attack most difficult problems associated with symmetric encryption, Describe these problems? Classify categories of PKC? List possible approaches to attacking RSA are:

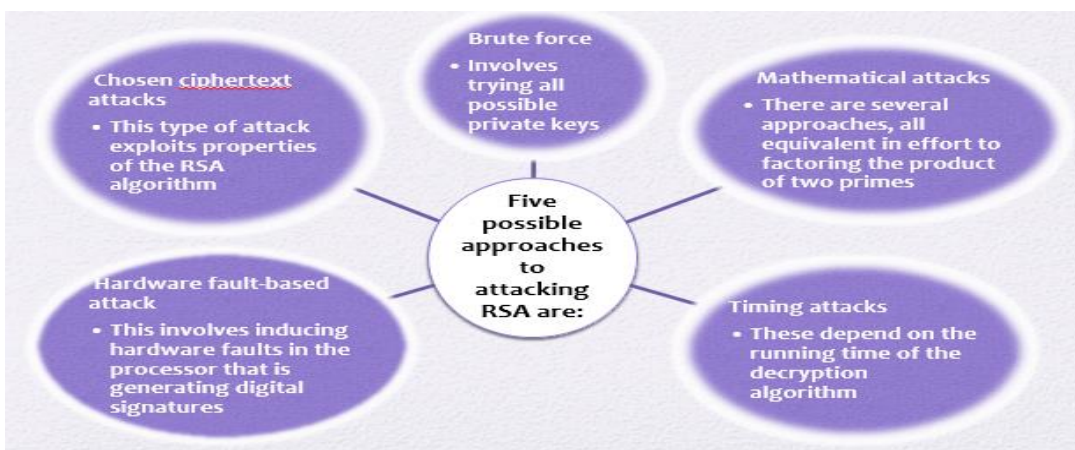

ANS: Describe these problems

ANS: Classify the categories of PKC:

ANS: List possible approaches to attacking RSA:

Q2) Pseudorandom number generators (PRNGs) are used in a variety of cryptographic and security applications.

- A. A number of network security algorithms and protocols based on cryptography make use of random binary numbers, Describe these algorithms and protocol.**
- B. There are distinct requirements for a sequence of random numbers, Describe it?**
- C. Summarizes using Table only the principal differences between PRNGs and TRNGs.**
- D. Describe approaches that use a block cipher to build a PNRG have gained widespread acceptance?**

ANS: (A,B)

- A number of network security algorithms and protocols based on cryptography make use of random binary numbers:
 - Key distribution and reciprocal authentication schemes
 - Session key generation
 - Generation of keys for the RSA public-key encryption algorithm
 - Generation of a bit stream for symmetric stream encryption

```

    graph LR
      A[There are two distinct requirements for a sequence of random numbers:] --- B[Randomness]
      A --- C[Unpredictability]
    
```

ANS: (C)

| | Pseudorandom Number Generators | True Random Number Generators |
|--------------------|---------------------------------------|--------------------------------------|
| Efficiency | Very efficient | Generally inefficient |
| Determinism | Deterministic | Nondeterministic |
| Periodicity | Periodic | Aperiodic |

ANS: (D)

- Two approaches that use a block cipher to build a PNRG have gained widespread acceptance:
 - **CTR mode (Counter)**
 Counter mode turns a [block cipher](#) into a [stream cipher](#). It generates the next [keystream](#) block by encrypting successive values of a "counter". The counter can be any function which produces a sequence which is guaranteed not to repeat for a long time, although an actual increment-by-one counter is the simplest and most popular.
 - Recommended in NIST SP 800-90, ANSI standard X.82, and RFC 4086
 - **OFB mode(Output Feedback)**
 The *Output Feedback* (OFB) mode makes a block cipher into a synchronous [stream cipher](#). It generates [keystream](#) blocks, which are then [XORed](#) with the plaintext blocks to get the [ciphertext](#).
 - Recommended in X9.82 and RFC 4086

Q3) Answer the following questions:

- 1) Decrypt the encrypted message “GYDPPKLRSMGOVM” Using PlayFair Algorithm with Keyword “DARKROOMS”:
- 2) Differentiate between Cryptanalysis and Brute-Force Attack
- 3) Describe Steganography? Various other techniques have been used historically; Give examples?

ANS: (1)

| | |
|-------------------------------|-------------------|
| Playfair keyword DARKROOMS | Action Decrypt |
|-------------------------------|-------------------|

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----------------|
| Playfair square | Transformed text | | | | | | | | | | | | | | | | | | | | | | | | | |
| <table border="1"><tr><td>D</td><td>A</td><td>R</td><td>K</td><td>O</td></tr><tr><td>M</td><td>S</td><td>B</td><td>C</td><td>E</td></tr><tr><td>F</td><td>G</td><td>H</td><td>I</td><td>L</td></tr><tr><td>N</td><td>P</td><td>Q</td><td>T</td><td>U</td></tr><tr><td>V</td><td>W</td><td>X</td><td>Y</td><td>Z</td></tr></table> | D | A | R | K | O | M | S | B | C | E | F | G | H | I | L | N | P | Q | T | U | V | W | X | Y | Z | IWANTAHOMELAND |
| D | A | R | K | O | | | | | | | | | | | | | | | | | | | | | | |
| M | S | B | C | E | | | | | | | | | | | | | | | | | | | | | | |
| F | G | H | I | L | | | | | | | | | | | | | | | | | | | | | | |
| N | P | Q | T | U | | | | | | | | | | | | | | | | | | | | | | |
| V | W | X | Y | Z | | | | | | | | | | | | | | | | | | | | | | |

ANS: (2)

- **Cryptanalysis:** Cryptanalytic attacks rely on the nature of the algorithm plus perhaps some knowledge of the general characteristics of the plaintext or even some sample plaintext–ciphertext pairs. This type of attack exploits the characteristics of the algorithm to attempt to deduce a specific plaintext or to deduce the key being used.
- **Brute-force attack:** The attacker tries every possible key on a piece of ciphertext until an intelligible translation into plaintext is obtained. On average, half of all possible keys must be tried to achieve success.

ANS: (3)

Steganography: A plaintext message may be hidden in one of two ways. The methods of **steganography** conceal the existence of the message, whereas the methods of cryptography render the message unintelligible to outsiders by various transformations of the text.

- **Character marking:** Selected letters of printed or typewritten text are over-written in pencil. The marks are ordinarily not visible unless the paper is held at an angle to bright light.
- **Invisible ink:** A number of substances can be used for writing but leave no visible trace until heat or some chemical is applied to the paper.
- **Pin punctures:** Small pin punctures on selected letters are ordinarily not visible unless the paper is held up in front of a light.
- **Typewriter correction ribbon:** Used between lines typed with a black ribbon, the results of typing with the correction tape are visible only under a strong light.

Q4) Answer the following questions:

- 1) Using Table only, Describe difficulties in defending against attacks?
- 2) Illustrate using Figure only Information security components?

ANS: (1)

| Reason | Description |
|---|--|
| Universally connected devices | Attackers from anywhere in the world can send attacks |
| Increased speed of attacks | Attackers can launch attacks against millions of computers within minutes |
| Greater sophistication of attacks | Attack tools vary their behavior so the same attack appears differently each time |
| Availability and simplicity of attack tools | Attacks are no longer limited to highly skilled attackers |
| Faster detection of vulnerabilities | Attackers can discover security holes in hardware or software more quickly |
| Delays in patching | Vendors are overwhelmed trying to keep pace by updating their products against attacks |
| Weak patch distribution | Many software products lack a means to distribute security patches in a timely fashion |
| Distributed attacks | Attackers use thousands of computers in an attack against a single computer or network |
| User confusion | Users are required to make difficult security decisions with little or no instruction |

Table 1-2 Difficulties in defending against attacks

ANS: (2)
