

between chromosomes. For that purpose the crossover used in this algorithm is the **Order Crossover (OX)** [91], this operator chooses two random crossover points, for example, if the parents are:

$$\begin{array}{l} v_1 : 7 \ 9 \ 8 \mid 2 \ 5 \ 1 \mid 6 \ 3 \ 4 \quad 7 \ 9 \ * \mid 2 \ 5 \ 1 \mid 6 \ * \ * \\ v_2 : 9 \ 5 \ 6 \mid 4 \ 8 \ 3 \mid 2 \ 7 \ 1 \quad \Rightarrow \ 9 \ * \ 6 \mid 4 \ 8 \ 3 \mid * \ 7 \ * \end{array}$$

Then put * instead of the digit repeated in the two sides of v_1 (or v_2) and in the middle of v_2 (or v_1), then distribute the sequence in the middle of v_1 (v_2) to the positions of * in the same v_1 (v_2).

$$\begin{array}{l} \Rightarrow \begin{array}{l} 7 \ 9 \ 2 \mid * \ * \ * \mid 5 \ 1 \ 6 \\ 9 \ 6 \ 4 \mid * \ * \ * \mid 8 \ 3 \ 7 \end{array} \Rightarrow \begin{array}{l} o_1 \ 7 \ 9 \ 2 \mid 4 \ 8 \ 3 \mid 5 \ 1 \ 6 \\ o_2 \ 9 \ 6 \ 4 \mid 2 \ 5 \ 1 \mid 8 \ 3 \ 7 \end{array} \end{array}$$

Lastly, exchange the digits in middle of v_1 with v_2 to obtain o_1 and o_2 .

• Mutation Operator

After the new generation has been determined, the chromosomes are subjected to a low rate mutation process. For this example applies two mutation operators to introduce genetic diversity into the evolving population of permutation. The first operator is a simple two point mutation, which randomly selects two elements in the chromosome and swap them (1 10 8 4 5 6 7 9 3 2) becomes (1 10 3 4 5 6 7 9 8 2). The second operator is a shuffle mutation, which shunts the permutations forward by a random number of places; thus (1 10 3 4 5 6 7 9 8 2) shuffled forward six places becomes (6 7 9 3 2 1 10 8 4 5).

• Genetic Parameters

For MSP, from our experience, the following parameters are preferred to be used: population size (pop_size=20), probability of crossover (Pc=0.7), probability of mutation Pm =0.1 and some hundreds number of generations.

$$P_1 \quad 1 \ 2 \mid 3 \ 4 \mid 5 \quad ch_1 = 1 \ * \mid 3 \ 4 \mid 5$$

$$P_2 \quad 5 \ 4 \mid 3 \ 2 \mid 1 \quad ch_2 = 5 \ * \mid 3 \ 2 \mid 1$$

$$ch_1 = 1 \ 3 \mid * \ * \mid 5 \quad O_1 \quad 1 \ 3 \ 2 \ 4 \ 5$$

$$ch_2 = 5 \ 3 \mid * \ * \mid 1 \quad O_2 \quad 5 \ 3 \ 2 \ 4 \ 1$$

$$P_1 : 5 \ 1 \mid 3 \ 2 \mid 4 \quad \Rightarrow \quad * \ * \mid 3 \ 2 \mid 4$$

$$P_2 : 4 \ 3 \mid 1 \ 5 \mid 2 \quad \Rightarrow \quad 4 \ * \mid 1 \ 5 \mid *$$

$$\begin{array}{c} \cancel{3} \ \cancel{2} \mid * \ * \mid 4 \\ 4 \ 1 \mid * \ * \mid 5 \end{array} \Rightarrow \begin{array}{c} O_1 = 3 \ 2 \mid 1 \ 5 \mid 4 \\ O_2 = 4 \ 1 \mid 3 \ 2 \mid 5 \end{array}$$

$$P_1 : 5 \ 1 \mid 3 \ 2 \mid 4 \quad \Rightarrow \quad * \ * \mid 3 \ 2 \mid 4$$

$$P_2 : 4 \ 3 \mid 1 \ 5 \mid 2 \quad \Rightarrow \quad 4 \ * \mid 1 \ 5 \mid *$$

$$\begin{array}{c} 3 \ 2 \mid * \ * \mid 4 \\ 4 \ 1 \mid * \ * \mid 5 \end{array} \Rightarrow \begin{array}{c} 3 \ 2 \mid 1 \ 5 \mid 4 \\ 4 \ 1 \mid 3 \ 2 \mid 5 \end{array}$$

Order Crossover (OX)

Solve the following TSP using the GA with population size $P=6$,

	1	2	3	4	5
1	-	3	6	2	3
2	3	-	8	1	9
3	5	7	-	2	7
4	4	5	8	-	6
5	2	4	3	7	-

Solution: Notice that $n=5$ and start from city **1**.

Let the $P=6$ chromosomes are as follows:

Initialization:

$$ch_1 = [4, 2, 5, 3], ch_2 = [5, 2, 4, 3], ch_3 = [2, 3, 4, 5]$$

$$ch_4 = [5, 4, 2, 3], ch_5 = [3, 2, 5, 4], ch_6 = [4, 2, 3, 5];$$

Fitness: ~~add~~ add city **1** for ch_4 which be $ch_1 = [1, 4, 2, 5, 3, 1]$.

$$\text{then } f_1 = 2 + 5 + 9 + 3 + 5 = 24$$

$$f_2 = 23, \underline{f_3 = 21}, f_4 = 28, f_5 = 33, f_6 = 26$$

Best fitness is $f_3 = 21$.

$$\text{Selection } F = \sum f_i = 155$$

$$d_i = 0.15, 0.15, 0.14, 0.18, 0.21, 0.17$$

we have intervals $[0, 15), [15, 30), [30, 44), [44, 62)$

$[62, 83), [83, 100)$.

(6) number are drawn: 50, ~~31~~, 20, 43, 17, 85

Then the following chromosomes are selected:

$$ch_4, ch_5, ch_2, ch_3, ch_2, ch_6$$

Crossover: $P_{\text{crossover}} = 0.7$

let $P_c = 0.65 \overset{\text{(change)}}{\uparrow} \leq 0.7$

$$\begin{aligned} ch_4 &= [5 | 4 | 2 | 3] & ch'_1 &= [* | 4 | 2 | 3] \\ ch_5 &= [3 | 2 | 5 | 4] & ch'_2 &= [3 | 2 | 5 | *] \end{aligned}$$

$$\begin{aligned} ch'_1 &= [4 | * | * | 3] & ch'_1 &= [4 | 2 | 5 | 3] \\ ch'_2 &= [3 | * | * | 2] & ch'_2 &= [3 | 4 | 2 | 5] \end{aligned}$$

let $P_c = 0.6 \leq 0.7$ (change)

$$\begin{aligned} ch_2 &= [5 | 2 | 4 | 3] & ch'_3 &= [5 | 3 | 4 | 2] \\ ch_3 &= [2 | 3 | 4 | 5] & ch'_4 &= [3 | 2 | 4 | 5] \end{aligned}$$

let $P_c = 0.8 > 0.7$ (no change)

$$\begin{aligned} ch_2 &= [5 | 2 | 4 | 3] & ch'_5 &= [5 | 2 | 4 | 3] \\ ch_6 &= [4 | 2 | 3 | 5] & ch'_6 &= [4 | 2 | 3 | 5] \end{aligned}$$

Mutations let $P_m = 0.07$. Swapping

- let $P_m = 0.08 > 0.07$ (no change) $ch_1 = ch'_1 = [4 | 2 | 5 | 3]$
- let $P_m = 0.06 \leq 0.07$ (change), let $l_k = 2$, then $ch_2 = [3 | 2 | 4 | 5]$
- let $P_m = 0.05 \leq 0.07$ (change), let $l_k = 3$, then $ch_3 = [5 | 3 | 2 | 4]$
- let $P_m = 0.1 > 0.07$ (no change), then $ch_4 = [3 | 2 | 4 | 5] = ch'_4$
- let $P_m = 0.09 > 0.07$ (no change), then $ch_5 = ch'_5 = [5 | 2 | 4 | 3]$
- let $P_m = 0.06 \leq 0.07$ (change), then $l_k = 1$, $ch_6 = [2 | 4 | 3 | 5]$

New Genes: $ch_1 = [4 | 2 | 5 | 3]$, $ch_2 = [3 | 2 | 4 | 5]$, ..., $ch_6 = [2 | 4 | 3 | 5]$

Fitness: $f_1 = 24$, $f_2 = 24$, $f_3 = 16$, $f_4 = 22$
 $f_5 = 21$, $f_6 = 22$

Best fitness $f_3 = 16$, for chromosome $ch_3 = [5 \ 3 \ 4 \ 2]$
with the path 1-5-3-4-2-1
