

# *Trees and Binary Trees*

## *Nature View of a Tree*

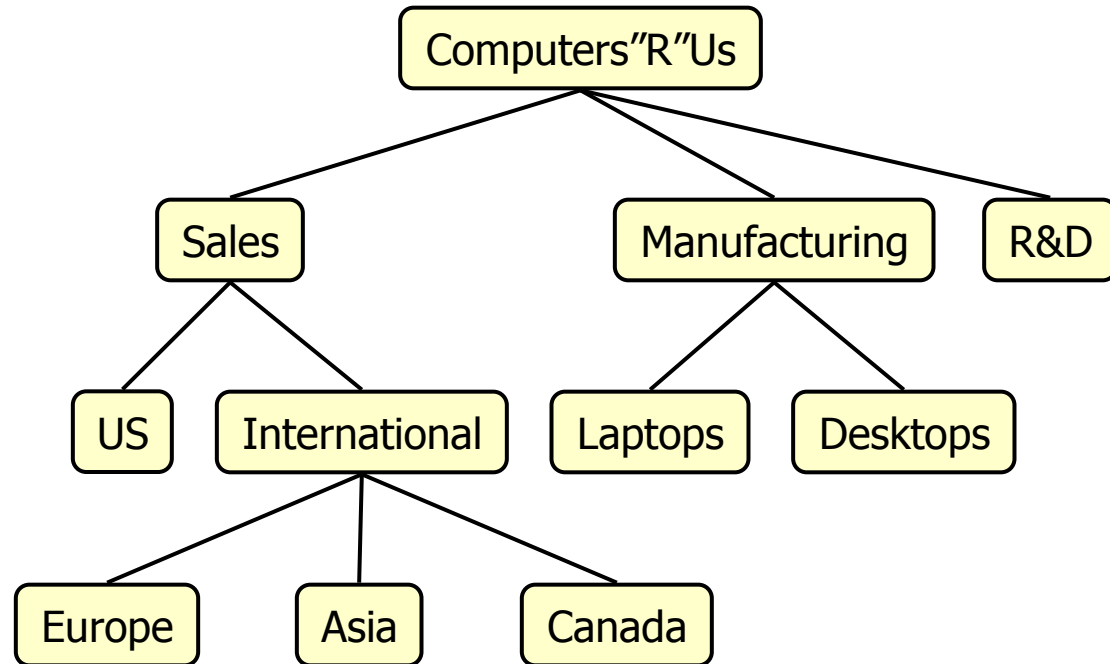

# *Computer Scientist's View*

# Tree Definition

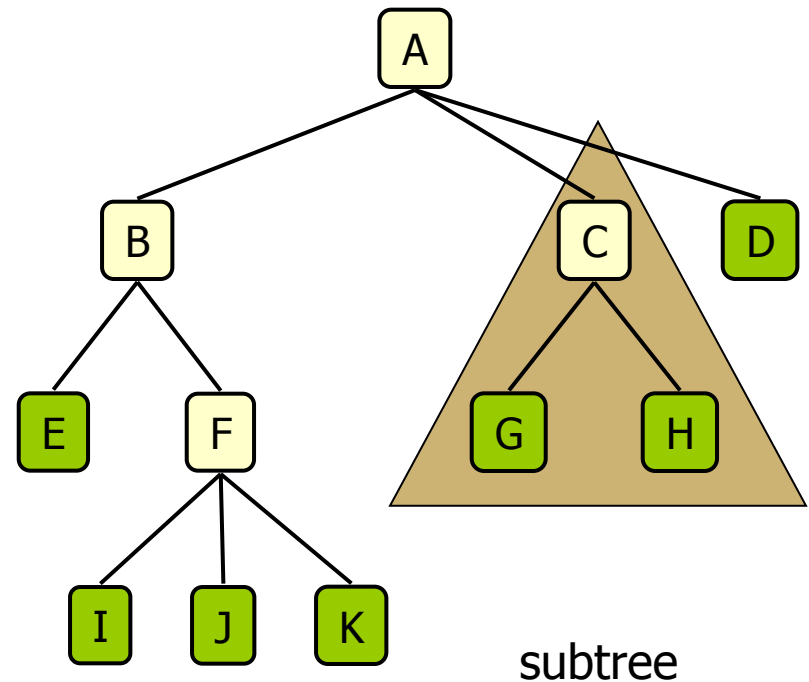

- ✦ A tree is a finite nonempty set of elements or nodes.
- ✦ Nodes are connected by **edges**.
- ✦ Each node contains a value or data, and it may or may not have a child node .
- ✦ It is an abstract model of a hierarchical structure (**non-linear**).
- ✦ consists of nodes with a parent-child relation.
- ✦ **Applications:**
  - ✦ Organization charts
  - ✦ File systems
  - ✦ Programming environments

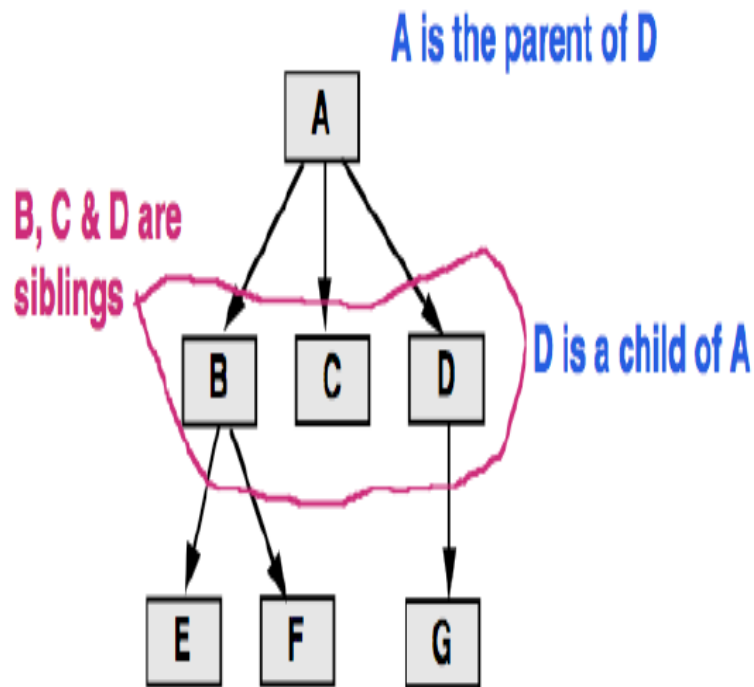

# Tree Terminology

- ✦ **Parents:**
  - ❑ The root has no parent.
  - ❑ Every other node has exactly one parent.
- ✦ **Root:** node without parent (A), the higher node a of the tree is the **root**.
- ✦ **Siblings:** nodes share the same parent
- ✦ **Internal node:** node with at least one child (A, B, C, F)
- ✦ **leaf:** node without children (E, I, J, K, G, H, D).
- ✦ **Branch:** The link between a parent and its child.
- ✦ **Ancestors** of a node: parent, grandparent, grand-grandparent, etc.
  - ❑ The root of the tree is the ancestor of all nodes in the tree.
- ✦ **Descendant** of a node: child, grandchild, grand-grandchild, etc.
- ✦ **Depth** of a node: number of ancestors
- ✦ **Height** of a tree: maximum depth of any node
- ✦ **Degree** of a node: the number of its children

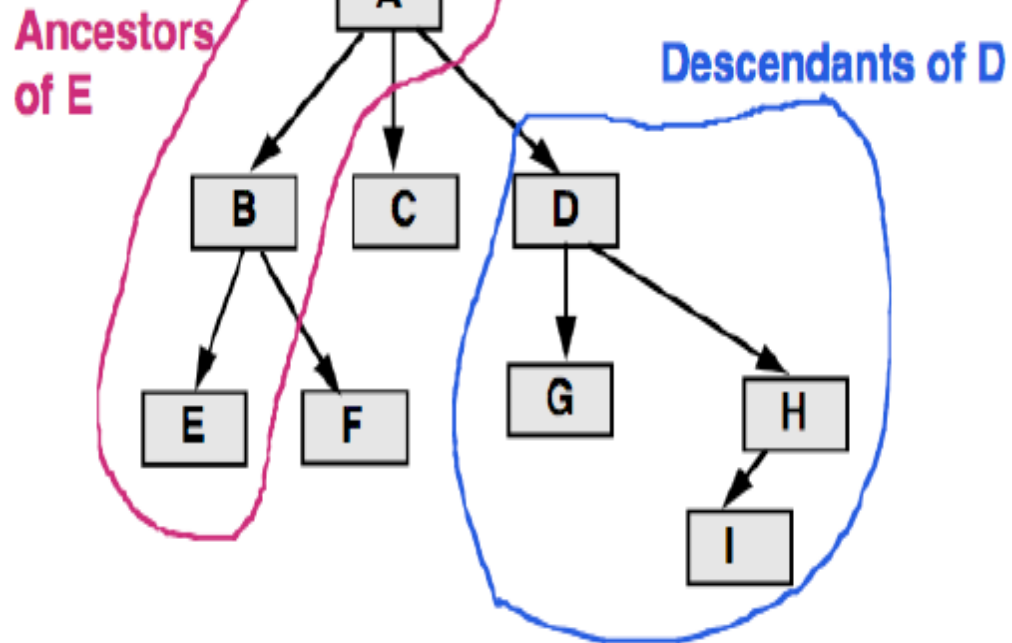

- ✦ **Degree** of a tree: the maximum number of its node.
- ✦ **Subtree:** tree consisting of a node and its descendants

Example of (Parent, child, siblings)

Example of (Ancestors, Descendants)

## Example of (Depth)

Depth = Level = 0

Depth = Level = 1

Depth = Level = 2

Depth = Level = 3

## Example of (High)

Height = 3

Depth = 3

**Height of a tree** – The longest path length from the root to a leaf.

- **Non empty tree: Height = max depth**

**node depth** – the path length from the root

- **The root is level 0 and depth**
- **Other nodes depth is 1 + depth of parent**

# Tree Properties

## Property

## Value

Number of nodes

Height

Root Node

Leaves

Interior nodes

Ancestors of H

Descendants of B

Siblings of E

Right subtree of A

Degree of this tree

# Representation of Tree Node

## List Representation

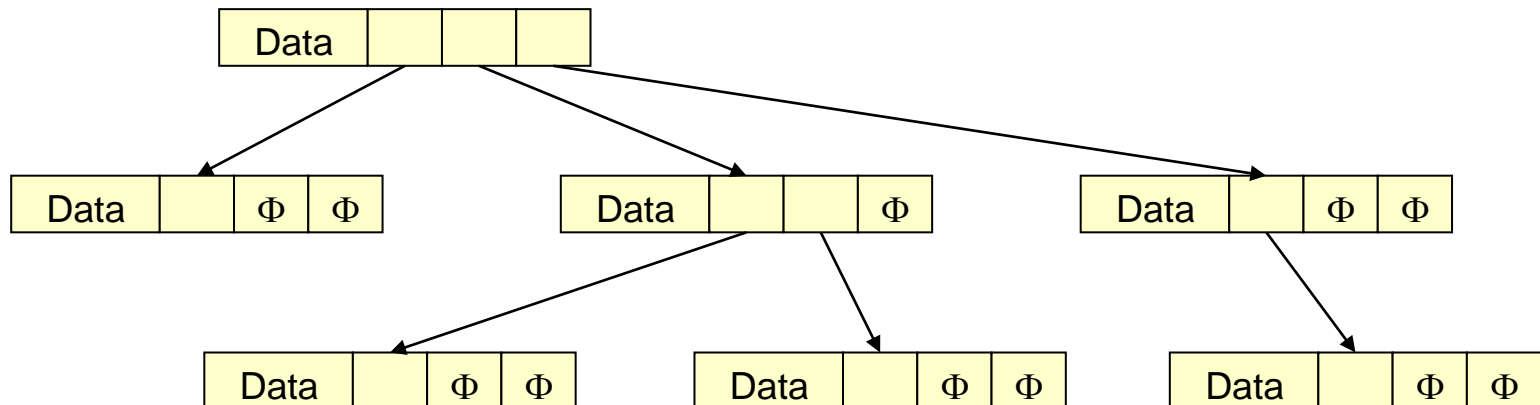

- ❖ ( A ( B ( E ( K, L ), F ), C ( G ), D ( H ( M ), I, J ) ) )
- ❖ The root comes first, followed by a list of links to sub-trees

How many link fields are needed in such a representation?

## Every tree node:

- ❖ **object** – useful information
- ❖ **children** – pointers to its children

# A Tree Representation

✿ A node is represented by an object storing

- ✿ Element
- ✿ Parent node
- ✿ Sequence of children nodes

# Binary trees

- Binary tree is a specific type of tree
- “In computer science, a binary tree is a tree data structure in which each node has at the most two children, which are referred to as the left child and the right child.”
- Properties:
  - ❖ Each internal node has at most two children (degree of two)
  - ❑ Each node is called the parent of its children
  - ❖ The children of a node are an ordered pair
  - ❖ We call the children of an internal node left child and right child
  - ❖ a binary tree is either:
    - a tree consisting of a single node, OR
    - a tree whose root has an ordered pair of children, each of which is a binary tree
  - ❖ A node with no children is called a leaf.
  - ❖ **Left child is always less than its parent, while right child is greater than its parent**
- Applications:
  - ❖ arithmetic expressions
  - ❖ decision processes
  - ❖ searching
