## Chapter Six <br> Linear momentum and collisions

## 6-1- Linear momentum

The linear momentum $\overline{\mathrm{P}}$ of a particle or an object is defined to be the product of the mass and velocity of the particle.

$$
\begin{equation*}
\overrightarrow{\mathrm{P}}=\mathrm{m} \overrightarrow{\mathrm{v}} \tag{1}
\end{equation*}
$$

Linear momentum is a vector quantity because it equals the product of a scalar quantity $m$ and a vector quantity $\vec{v}$. Its direction is along $\overrightarrow{\mathrm{v}}$, it has dimensions ML/T, and its SI unit is $\mathrm{kg} . \mathrm{m} / \mathrm{s}$.
If a particle is moving in an arbitrary direction, $\stackrel{\rightharpoonup}{\mathrm{P}}$ has three components, and Eq. (1) is equivalent to the component equations

$$
\mathrm{P}_{\mathrm{x}}=\mathrm{mv}_{\mathrm{x}} \quad \mathrm{P}_{\mathrm{y}}=\mathrm{mv}_{\mathrm{y}} \quad \mathrm{P}_{\mathrm{z}}=\mathrm{mv}_{\mathrm{z}}
$$

We can express Newton's second law of motion in terms of momentum

$$
\sum \overrightarrow{\mathrm{F}}=\mathrm{m} \overline{\mathrm{a}}=\mathrm{m} \frac{\mathrm{~d}}{\mathrm{~d}} \mathrm{t}
$$

If the mass $m$ is constant

$$
\sum \overrightarrow{\mathrm{F}}=\frac{\mathrm{d}(\mathrm{~m} \overline{\mathrm{v}})}{\mathrm{dt}}=\frac{\mathrm{d} \stackrel{\rightharpoonup}{\mathrm{P}}}{\mathrm{dt}}
$$

"The net force acting on a particle equals the time rate of change of momentum of the particle".

## 6-2- Isolated system (Momentum)

Consider an isolated system of two particles as shown in the figure below, with masses $m_{1}$ and $m_{2}$ moving with velocities $\vec{v}_{1}$ and $\vec{v}_{2}$ at an instant of time. Because the system is isolated, the only force on one particle is that from the other article. If a force $\bar{F}_{12}$ from particle 1 acts on particle 2, there must be a second force $\bar{F}_{21}$ from particle 2 exerts on particle 1 equal in magnitude but opposite in direction. That is, form a Newton's third law:

$$
\begin{aligned}
& \overrightarrow{\mathrm{F}}_{12}=-\overrightarrow{\mathrm{F}}_{21} \\
& \stackrel{\rightharpoonup}{\mathrm{~F}}_{21}+\overrightarrow{\mathrm{F}}_{12}=0 \\
& \mathrm{~m}_{1} \overline{\mathrm{a}}_{1}+\mathrm{m}_{2} \overline{\mathrm{a}}_{2}=0
\end{aligned}
$$

$\mathrm{m}_{1} \frac{\mathrm{~d} \overrightarrow{\mathrm{v}}_{1}}{\mathrm{dt}}+\mathrm{m}_{2} \frac{\mathrm{~d} \overrightarrow{\mathrm{v}}_{2}}{\mathrm{dt}}=0$
If the masses $m_{1}$ and $m_{2}$ are constant
$\frac{\mathrm{d}\left(\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{1}\right)}{\mathrm{dt}}+\frac{\mathrm{d}\left(\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2}\right)}{\mathrm{dt}}=0$
$\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{1}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2}\right)=0$
$\frac{\mathrm{d}}{\mathrm{dt}}\left(\stackrel{\rightharpoonup}{\mathrm{P}}_{1}+\stackrel{\rightharpoonup}{\mathrm{P}}_{2}\right)=0$
$\frac{\mathrm{d}}{\mathrm{dt}} \stackrel{\mathrm{P}}{\text { tot }}=0$
$\stackrel{\rightharpoonup}{\mathrm{P}}_{\text {tot }}=$ constant

$\stackrel{\rightharpoonup}{\mathrm{P}}_{1 \mathrm{i}}+\stackrel{\rightharpoonup}{\mathrm{P}}_{2 \mathrm{i}}=\stackrel{\rightharpoonup}{\mathrm{P}}_{1 \mathrm{f}}+\stackrel{\rightharpoonup}{\mathrm{P}}_{2 \mathrm{f}}$
Eq.(3) can be written
$\mathrm{P}_{\text {lix }}+\mathrm{P}_{2 \mathrm{ix}}=\mathrm{P}_{1 \mathrm{fx}}+\mathrm{P}_{2 \mathrm{fx}}$
$\mathrm{P}_{\text {liy }}+\mathrm{P}_{2 \text { iy }}=\mathrm{P}_{\text {1fy }}+\mathrm{P}_{2 \text { fy }}$
$\mathrm{P}_{\text {liz }}+\mathrm{P}_{2 \mathrm{iz}}=\mathrm{P}_{1 \mathrm{tz} z}+\mathrm{P}_{2 \mathrm{fz}}$

Whenever two or more particles in an isolated system interact, the total momentum of the system does not change.

## 6-3- Nonisolated system (Momentum)

Consider a particle acted on by a net force $\sum \overrightarrow{\mathrm{F}}$ during a time interval $\Delta \mathrm{t}$ from $\mathrm{t}_{\mathrm{i}}$ to $\mathrm{t}_{\mathrm{f}}$.
From Newton's second law:

$$
\sum \stackrel{\rightharpoonup}{\mathrm{F}}=\frac{\mathrm{d} \stackrel{\rightharpoonup}{\mathrm{P}}}{\mathrm{dt}} \quad \text { or } \quad \sum \stackrel{\mathrm{F} d t}{\mathrm{~F}}=\mathrm{d} \overline{\mathrm{P}}
$$

The change in the momentum due to $\sum \overrightarrow{\mathrm{F}}$ during the time interval $\Delta \mathrm{t}$ from $\mathrm{t}_{\mathrm{i}}$ to $\mathrm{t}_{\mathrm{f}}$ $\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{t}}} \sum \overrightarrow{\mathrm{F}} \mathrm{dt}=\int_{\vec{P}_{\mathrm{i}}}^{\stackrel{\rightharpoonup}{\mathrm{P}}_{\mathrm{i}}} \mathrm{d} \overrightarrow{\mathrm{P}}=\overrightarrow{\mathrm{P}}_{\mathrm{f}}-\overrightarrow{\mathrm{P}}_{\mathrm{i}}$
$\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{i}}} \sum \stackrel{\rightharpoonup}{\mathrm{F} d t}=\Delta \stackrel{\rightharpoonup}{\mathrm{P}}$
The quantity $\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{i}}} \sum \overrightarrow{\mathrm{F}} \mathrm{dt}$ is called impulse $\overrightarrow{\mathrm{J}}$ and is equal to change in the linear momentum.

$$
\begin{equation*}
\overrightarrow{\mathrm{J}}=\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{t}}} \sum \stackrel{\rightharpoonup}{\mathrm{~F}} \mathrm{dt} \tag{4}
\end{equation*}
$$

$\stackrel{\rightharpoonup}{\mathbf{J}}=\Delta \stackrel{\rightharpoonup}{\mathrm{P}}$
(Impulse-momentum theorem)

The change in the momentum of a particle is equal to the impulse of the net force acting on the particle.

If the net force $\sum \stackrel{\rightharpoonup}{\mathrm{F}}$ is constant, then eq.(4) can be written
$\overrightarrow{\mathrm{J}}=\sum \stackrel{\rightharpoonup}{\mathrm{F}} \Delta \mathrm{t}$
In the case $\sum \overrightarrow{\mathrm{F}}$ varies with time, we can define an average net force $\left(\sum \overrightarrow{\mathrm{F}}\right)_{\mathrm{av}}$ $\overrightarrow{\mathrm{J}}=\left(\sum \overrightarrow{\mathrm{F}}\right)_{\mathrm{av}} \Delta \mathrm{t}$

Eq.(4), can be written in component form

$$
\begin{align*}
& \mathrm{J}_{\mathrm{x}}=\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{f}}} \sum \mathrm{~F}_{\mathrm{x}} \mathrm{dt}=\mathrm{P}_{\mathrm{xf}}-\mathrm{P}_{\mathrm{xi}}=\mathrm{mv}_{\mathrm{xf}}-\mathrm{mv}_{\mathrm{xi}}  \tag{8}\\
& \mathrm{~J}_{\mathrm{y}}=\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{t}}} \sum \mathrm{~F}_{\mathrm{y}} \mathrm{dt}=\mathrm{P}_{\mathrm{yf}}-\mathrm{P}_{\mathrm{yi}}=\mathrm{mv}_{\mathrm{yf}}-\mathrm{mv}_{\mathrm{yi}}  \tag{9}\\
& \mathrm{~J}_{\mathrm{z}}=\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}_{\mathrm{f}}} \sum \mathrm{~F}_{\mathrm{z}} \mathrm{dt}=\mathrm{P}_{\mathrm{zf}}-\mathrm{P}_{\mathrm{zi}}=\mathrm{mv}_{\mathrm{zf}}-\mathrm{mv}_{\mathrm{zi}} \tag{10}
\end{align*}
$$

Ex: A 60 kg archer stands at rest on frictionless ice and fires a 0.030 kg arrow horizontally at $85 \mathrm{~m} / \mathrm{s}$ as shown in the figure below. With what velocity does the archer move across the ice after firing the arrow?

Soln:

$$
\begin{aligned}
& \Delta \overrightarrow{\mathrm{P}}=0 \quad \rightarrow \quad \overrightarrow{\mathrm{P}}_{\mathrm{f}}-\overrightarrow{\mathrm{P}}_{\mathrm{i}}=0 \quad \rightarrow \quad \overrightarrow{\mathrm{P}}_{\mathrm{i}}=\overrightarrow{\mathrm{P}}_{\mathrm{f}} \\
& \left(\mathrm{~m}_{1} \stackrel{\rightharpoonup}{\mathrm{v}}_{1 \mathrm{i}}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2 \mathrm{i}}\right)=\left(\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{\mathrm{lf}}+\mathrm{m}_{2} \stackrel{\rightharpoonup}{\mathrm{v}}_{2 \mathrm{f}}\right) \\
& \left(\mathrm{m}_{1}(0)+\mathrm{m}_{2}(0)\right)=\left(\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{\mathrm{lf}}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2 \mathrm{f}}\right) \\
& 0=\left(\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{\mathrm{lf}}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2 \mathrm{f}}\right) \rightarrow \quad \overrightarrow{\mathrm{v}}_{\mathrm{lf}}=-\left(\frac{\mathrm{m}_{2}}{\mathrm{~m}_{1}}\right) \stackrel{\rightharpoonup}{\mathrm{v}}_{2 \mathrm{f}} \\
& \overrightarrow{\mathrm{v}}_{1 \mathrm{f}}=-\left(\frac{0.03}{60}\right)(85 \hat{\mathrm{i}})=-0.042 \hat{\mathrm{i}} \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

Ex: In a particular crash test, a car of mass 1500 kg collides with a wall as shown in figure below. The initial and final velocities of the car are $\vec{v}_{i}=-15 \hat{\mathrm{i}} \mathrm{m} / \mathrm{s}$ and $\overrightarrow{\mathrm{v}}_{\mathrm{f}}=2.6 \hat{\mathrm{i}} \mathrm{m} / \mathrm{s}$, respectively. If the collision lasts 0.15 s , find the impulse caused by the collision and the average net force exerted on the car.

Soln:
$\overrightarrow{\mathrm{J}}=\Delta \overrightarrow{\mathrm{P}} \quad \rightarrow \quad \overrightarrow{\mathrm{J}}=\overrightarrow{\mathrm{P}}_{\mathrm{f}}-\overrightarrow{\mathrm{P}}_{\mathrm{i}}$
$\overrightarrow{\mathrm{J}}=\mathrm{m}\left(\overrightarrow{\mathrm{v}}_{\mathrm{f}}-\overrightarrow{\mathrm{v}}_{\mathrm{i}}\right)=1500(2.6 \hat{\mathrm{i}}+15 \hat{\mathrm{i}})=2.64 \times 10^{4} \hat{\mathrm{i}} \mathrm{Kg} . \mathrm{m} / \mathrm{s}$

$$
\stackrel{\rightharpoonup}{\mathrm{J}}=\left(\sum \overrightarrow{\mathrm{F}}\right)_{\mathrm{av}} \Delta \mathrm{t} \rightarrow\left(\sum \overrightarrow{\mathrm{~F}}\right)_{\mathrm{av}}=\frac{\stackrel{\rightharpoonup}{\mathrm{J}}}{\Delta \mathrm{t}}=\frac{2.64 \times 10^{4} \hat{\mathrm{i}}}{0.15}=1.76 \times 10^{5} \hat{\mathrm{i}} \mathrm{~N}
$$

Ex: An estimated force-time curve for a baseball struck by a bat is shown in Figure below. From this curve, determine (a) the impulse delivered to the ball, (b) the average force exerted on the ball, and (c) the peak force exerted on the ball.

Soln:
a) $J=\int_{\mathrm{t}_{\mathrm{i}}}^{\mathrm{t}^{2}} \sum$ Fdt $=$ area under curve $\mathrm{J}=\frac{1}{2}\left(1.5 \times 10^{-3} \mathrm{~s}\right)(18000 \mathrm{~N})=13.5 \mathrm{~N} . \mathrm{s}$
b) $\mathrm{F}=\frac{13.5 \mathrm{~N} . \mathrm{s}}{1.5 \times 10^{-3}}=9000 \mathrm{~N}$
c) From graph, we see that $F_{\text {max }}=18000 \mathrm{~N}$

Ex: You throw a ball with a mass of 0.4 kg against a brick wall. It hits the wall moving horizontally to the left at $30 \mathrm{~m} / \mathrm{s}$ and rebounds horizontally to the right at $20 \mathrm{~m} / \mathrm{s}$ (a) Find the impulse of the net force on the ball during its collision with the wall. (b) If the ball is in contact with the wall for 0.010 s , find the average horizontal force that the wall exerts on the ball during the impact

Soln:
$\mathrm{J}_{\mathrm{x}}=\Delta \mathrm{P}_{\mathrm{x}} \rightarrow \mathrm{J}_{\mathrm{x}}=\mathrm{P}_{\mathrm{xf}}-\mathrm{P}_{\mathrm{xi}}$
$\mathrm{J}_{\mathrm{x}}=\mathrm{m}\left(\mathrm{v}_{\mathrm{xf}}-\mathrm{v}_{\mathrm{xi}}\right)=(0.4)(20+30)=20 \mathrm{Kg} \cdot \mathrm{m} / \mathrm{s}$
$\mathrm{J}_{\mathrm{x}}=\left(\sum \mathrm{F}_{\mathrm{x}}\right)_{\mathrm{av}} \Delta \mathrm{t} \rightarrow\left(\sum \mathrm{F}_{\mathrm{x}}\right)_{\mathrm{av}}=\frac{\mathrm{J}_{\mathrm{x}}}{\Delta \mathrm{t}}=\frac{20}{0.01}=2000 \mathrm{~N}$

## 6-4- Collisions in one dimension

The term collision represents an event during which two particles come close to each other and interact by means of forces.

Collisions are categorized as being either elastic or inelastic depending on whether or not kinetic energy is conserved.

An elastic collision between two objects is one in which the total kinetic energy (as well as total momentum) of the system is the same before and after the collision. For example, collision between billiard balls.

An inelastic collision is one in which the total kinetic energy of the system is not the same before and after the collision (even though the momentum of the system is conserved). Inelastic collisions are of two types. When the objects stick together after they collide, as happens when a meteorite collides with the Earth, the collision is called perfectly inelastic.

When the colliding objects do not stick together but some kinetic energy is transformed or transferred away, as in the case of a rubber ball colliding with a hard surface, the collision is called inelastic.

## 6-4-1- Perfectly inelastic collisions

Consider two particles of masses $m_{1}$ and $m_{2}$ moving with initial velocities $\overrightarrow{\mathrm{v}}_{1 \mathrm{i}}$ and $\overrightarrow{\mathrm{v}}_{2 \mathrm{i}}$ along the same straight line as shown in figure below. The two particles collide head on, stick together, and then move with some common velocity $\overrightarrow{\mathrm{v}}_{\mathrm{f}}$ after the collision.

Because the momentum of an isolated system is conserved in any collision, we can say that the total momentum before the collision equals the total momentum of the composite system after the collision:

$$
\begin{aligned}
& \Delta \stackrel{\rightharpoonup}{\mathrm{P}}=0 \rightarrow \quad \overrightarrow{\mathrm{P}}_{\mathrm{i}}=\overrightarrow{\mathrm{P}}_{\mathrm{f}} \\
& \mathrm{~m}_{1} \overrightarrow{\mathrm{v}}_{\mathrm{ii}}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2 \mathrm{i}}=\left(\mathrm{m}_{1}+\mathrm{m}_{2}\right) \stackrel{\rightharpoonup}{\mathrm{v}}_{\mathrm{f}} \\
& \overrightarrow{\mathrm{v}}_{\mathrm{f}}=\frac{\mathrm{m}_{1} \overrightarrow{\mathrm{v}}_{1 \mathrm{i}}+\mathrm{m}_{2} \overrightarrow{\mathrm{v}}_{2 \mathrm{i}}}{\left(\mathrm{~m}_{1}+\mathrm{m}_{2}\right)}
\end{aligned}
$$

## 6-4-2- Elastic collisions

Consider two particles of masses $\mathrm{m}_{1}$ and $\mathrm{m}_{2}$ moving with initial velocities $\overrightarrow{\mathrm{v}}_{1 \mathrm{i}}$ and $\overrightarrow{\mathrm{v}}_{2 \mathrm{i}}$ along the same straight line as shown in figure below. The two particles collide head on, then leave the collision site with different velocities $\vec{v}_{1 f}$ and $\vec{v}_{2 f}$. In an elastic collision, both the momentum and kinetic energy of the system are conserved. Therefore, considering velocities along the horizontal direction

$$
\begin{align*}
& P_{i}=P_{f} \quad \rightarrow \quad m_{1} v_{1 i}+m_{2} v_{2 i}=m_{1} v_{1 f}+m_{2} v_{2 f} \\
& m_{1}\left(v_{1 i}-v_{\text {lf }}\right)=m_{2}\left(v_{2 f}-v_{2 i}\right)  \tag{1}\\
& K_{i \mathrm{i}}=K_{f} \quad \rightarrow \quad \frac{1}{2} m_{1} v_{1 i}^{2}+\frac{1}{2} m_{2} v_{2 i}^{2}=\frac{1}{2} m_{1} v_{1 f}^{2}+\frac{1}{2} m_{2} v_{2 f}^{2} \\
& m_{1}\left(v_{1 i}^{2}-v_{\text {lf }}^{2}\right)=m_{2}\left(v_{2 f}^{2}-v_{2 i}^{2}\right) \\
& m_{1}\left(v_{1 i}-v_{1 f}\right)\left(v_{1 i}+v_{1 f}\right)=m_{2}\left(v_{2 f}-v_{2 i}\right)\left(v_{2 f}+v_{2 i}\right) \quad \ldots . \tag{2}
\end{align*}
$$

Divided eq.(1) by eq.(2):
$v_{1 i}+v_{1 f}=v_{2 f}+v_{2 i}$

Ex: An 1800 kg car stopped at a traffic light is struck from the rear by a 900 kg car. The two cars become entangled, moving along the same path as that of the originally moving car. If the smaller car were moving at $20 \mathrm{~m} / \mathrm{s}$ before the collision, what is the velocity of the entangled cars after the collision?

Soln:

$$
\begin{aligned}
& \mathrm{m}_{1}=1800 \mathrm{Kg}, \mathrm{v}_{\mathrm{li}}=0 \quad \mathrm{~m}_{2}=900 \mathrm{Kg}, \mathrm{v}_{2 \mathrm{i}}=20 \mathrm{~m} / \mathrm{s} \\
& \mathrm{v}_{\mathrm{f}}=\frac{\mathrm{m}_{1} \mathrm{v}_{\mathrm{il}}+\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{i}}}{\left(\mathrm{~m}_{1}+\mathrm{m}_{2}\right)} \rightarrow \mathrm{v}_{\mathrm{f}}=\frac{\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{i}}}{\left(\mathrm{~m}_{1}+\mathrm{m}_{2}\right)}=\frac{900 \times 20}{1800+900}=6.67 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

## 6-5- Collisions in two dimensions

For two-dimensional collisions, we obtain two component equations for conservation of momentum:

$$
\begin{array}{lllll}
\Delta \mathrm{P}_{\mathrm{x}}=0 & \rightarrow & \mathrm{P}_{\text {ix }}=\mathrm{P}_{\mathrm{fx}} & \rightarrow & \mathrm{~m}_{1} \mathrm{v}_{\text {lix }}+\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{ix}}=\mathrm{m}_{1} \mathrm{v}_{1 \mathrm{fx}}+\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{fx}} \\
\Delta \mathrm{P}_{\mathrm{y}}=0 & \rightarrow & \mathrm{P}_{\text {iy }}=\mathrm{P}_{\mathrm{fy}} & \rightarrow & \mathrm{~m}_{1} \mathrm{v}_{\text {liy }}+\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{iy}}=\mathrm{m}_{1} \mathrm{v}_{\text {lfy }}+\mathrm{m}_{2} \mathrm{v}_{2 f \mathrm{fy}}
\end{array}
$$

Consider a specific two-dimensional problem in which particle 1 of mass $m_{1}$ collides with particle 2 of mass $m_{2}$ initially at rest as in figure below. After the collision, particle 1 moves at an angle $\theta$ with respect to the horizontal and particle 2 moves at an angle $\phi$ with respect to the horizontal. This event is called a glancing collision. Applying the law of conservation of momentum in component form and noting that the initial $y$ component of the momentum of the two-particle system is zero gives:
$\mathrm{m}_{1} \mathrm{v}_{\mathrm{li}}+0=\mathrm{m}_{1} \mathrm{v}_{\mathrm{lf}} \cos \theta+\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{f}} \cos \varphi$
$0=\mathrm{m}_{1} \mathrm{v}_{\mathrm{lf}} \sin \theta-\mathrm{m}_{2} \mathrm{v}_{2 \mathrm{f}} \sin \phi$
If the collision is elastic:
$\mathrm{K}_{\mathrm{i}}=\mathrm{K}_{\mathrm{f}} \quad \rightarrow \quad \frac{1}{2} \mathrm{~m}_{1} \mathrm{v}_{\mathrm{li}}^{2}+0=\frac{1}{2} \mathrm{~m}_{1} \mathrm{v}_{\mathrm{lf}}^{2}+\frac{1}{2} \mathrm{~m}_{2} \mathrm{v}_{2 \mathrm{f}}^{2}$

If the collision is inelastic, kinetic energy is not conserved and the above equation does not apply.

Ex: A 1500 kg car traveling east with a speed of $25 \mathrm{~m} / \mathrm{s}$ collides at an intersection with a 2500 kg truck traveling north at a speed of $20 \mathrm{~m} / \mathrm{s}$ as shown in figure below. Find the direction and magnitude of the velocity of the wreckage after the collision, assuming the vehicles stick together after the collision.
Soln:

$$
\begin{align*}
& \Delta \mathrm{P}_{\mathrm{x}}=0 \rightarrow \sum \mathrm{P}_{\mathrm{xi}}=\sum \mathrm{P}_{\mathrm{xf}} \rightarrow \mathrm{~m}_{1} \mathrm{v}_{\mathrm{li}}=\left(\mathrm{m}_{1}+\mathrm{m}_{2}\right) \mathrm{v}_{\mathrm{f}} \cos \theta  \tag{1}\\
& \Delta \mathrm{P}_{\mathrm{y}}=0 \rightarrow \sum \mathrm{P}_{\mathrm{yi}}=\sum \mathrm{P}_{\mathrm{yf}} \rightarrow \mathrm{~m}_{2} \mathrm{v}_{2 \mathrm{i}}=\left(\mathrm{m}_{1}+\mathrm{m}_{2}\right) \mathrm{v}_{\mathrm{f}} \sin \theta \tag{2}
\end{align*}
$$

Ex: A 3 kg steel ball strikes a wall with a speed of $10 \mathrm{~m} / \mathrm{s}$ at an angle of $60^{\circ}$ with the surface. It bounces off with the same speed and angle as shown in the figure below. If the ball is in contact with the wall for 0.2 s , what is the average force exerted by the wall on the ball?

Soln:

$$
\begin{aligned}
& \Delta \mathrm{P}_{\mathrm{y}}=\mathrm{m}\left(\mathrm{v}_{\mathrm{fy}}-\mathrm{v}_{\mathrm{iy}}\right)=\mathrm{m}\left(\mathrm{v} \cos 60^{\circ}-\mathrm{v} \cos 60^{\circ}\right)=0 \\
& \Delta \mathrm{P}_{\mathrm{x}}=\mathrm{m}\left(\mathrm{v}_{\mathrm{fx}}-\mathrm{v}_{\text {ix }}\right)=\mathrm{m}\left(-\mathrm{v} \sin 60^{\circ}-\mathrm{v} \sin 60^{\circ}\right)=-2 \mathrm{mv} \sin 60^{\circ} \\
& \Delta \mathrm{P}_{\mathrm{x}}=-2(3 \mathrm{~kg})(10 \mathrm{~m} / \mathrm{s})(0.866)=-52 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s} \\
& \Delta \stackrel{\rightharpoonup}{\mathrm{P}}=\left(\sum \stackrel{\rightharpoonup}{\mathrm{F}}\right)_{\mathrm{av}} \Delta \mathrm{t} \rightarrow\left(\sum \mathrm{~F}\right)_{\mathrm{av}}=\frac{\Delta \mathrm{P}_{\mathrm{x}}}{\Delta \mathrm{t}}=\frac{-52}{0.2}=-260 \mathrm{~N}
\end{aligned}
$$

## 6-6- The center of mass

The center of mass of a system of particles is the point that moves as though: (1-) all of the system's mass were concentrated there, and (2-) all external forces were applied there.

## 6-6-1-System of particles:

The center of mass of the pair of particles described in figure below is located on the $x$ axis and lies somewhere between the particles. Its $x$ coordinate is given by

$$
\mathrm{x}_{\mathrm{CM}}=\frac{\mathrm{m}_{1} \mathrm{x}_{1}+\mathrm{m}_{2} \mathrm{x}_{2}}{\mathrm{~m}_{1}+\mathrm{m}_{2}}
$$

The $x$ coordinate of the center of mass of $n$ particles is defined to be

$$
\begin{equation*}
\mathrm{x}_{\mathrm{CM}}=\frac{\mathrm{m}_{1} \mathrm{x}_{1}+\mathrm{m}_{2} \mathrm{x}_{2}+\mathrm{m}_{3} \mathrm{x}_{3}+\cdots+\mathrm{m}_{\mathrm{n}} \mathrm{x}_{\mathrm{n}}}{\mathrm{~m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}+\cdots+\mathrm{m}_{\mathrm{n}}}=\frac{\sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}}{\sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}}}=\frac{\sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}}{\mathrm{M}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}} \tag{1}
\end{equation*}
$$

The $y$ and $z$ coordinates of the center of mass are similarly defined by the equations

$$
\begin{align*}
& \mathrm{y}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}  \tag{2}\\
& \mathrm{z}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{z}_{\mathrm{i}} \tag{3}
\end{align*}
$$

The center of mass can be located in three dimensions by its position vector $\overrightarrow{\mathrm{r}}_{\mathrm{CM}}$

$$
\begin{align*}
& \overrightarrow{\mathrm{r}}_{\mathrm{CM}}=\mathrm{x}_{\mathrm{CM}} \hat{\mathrm{i}}+\mathrm{y}_{\mathrm{CM}} \hat{\mathrm{j}}+\mathrm{z}_{\mathrm{CM}} \hat{\mathrm{k}}  \tag{4}\\
& \overrightarrow{\mathrm{r}}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}} \hat{\mathrm{i}}+\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}} \hat{\mathrm{j}}+\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \mathrm{z}_{\mathrm{i}} \hat{\mathrm{k}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \stackrel{\rightharpoonup}{\mathrm{i}}_{\mathrm{i}} \tag{5}
\end{align*}
$$

Where $\vec{r}_{i}=x_{i} \hat{i}+y_{i} \hat{j}+z_{i} \hat{k}$
The velocity of the center of mass of a system of particles

$$
\begin{equation*}
\overrightarrow{\mathrm{v}}_{\mathrm{CM}}=\frac{\mathrm{d} \overrightarrow{\mathrm{r}}_{\mathrm{CM}}}{\mathrm{dt}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \frac{\mathrm{~d} \overrightarrow{\mathrm{r}}_{\mathrm{i}}}{\mathrm{dt}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \overrightarrow{\mathrm{v}}_{\mathrm{i}} \tag{6}
\end{equation*}
$$

The acceleration of the center of mass of system of particles

$$
\begin{equation*}
\overrightarrow{\mathrm{a}}_{\mathrm{CM}}=\frac{\mathrm{d} \overrightarrow{\mathrm{v}}_{\mathrm{CM}}}{\mathrm{dt}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \frac{\mathrm{~d} \overrightarrow{\mathrm{v}}_{\mathrm{i}}}{\mathrm{dt}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \overrightarrow{\mathrm{a}}_{\mathrm{i}} \tag{7}
\end{equation*}
$$

Newton's second law:

$$
\begin{equation*}
M \overrightarrow{\mathrm{a}}_{\mathrm{CM}}=\sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \overrightarrow{\mathrm{a}}_{\mathrm{i}}=\sum_{\mathrm{i}} \overrightarrow{\mathrm{~F}}_{\mathrm{i}} \tag{8}
\end{equation*}
$$

The total momentum of a system of particles:

$$
\begin{equation*}
\mathrm{M} \overrightarrow{\mathrm{v}}_{\mathrm{CM}}=\sum_{\mathrm{i}} \mathrm{~m}_{\mathrm{i}} \overrightarrow{\mathrm{v}}_{\mathrm{i}}=\sum_{\mathrm{i}} \overrightarrow{\mathrm{p}}_{\mathrm{i}}=\overrightarrow{\mathrm{P}}_{\mathrm{tot}} \tag{9}
\end{equation*}
$$

## 6-6-2-Solid objects:

An ordinary object, contains so many particles can best treat it as a continuous distribution of matter. The particles then become differential mass elements dm, the sums of Eq. 1 become integrals, and the coordinates of the center of mass are defined as:

$$
\begin{align*}
& \mathrm{x}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \mathrm{xdm}  \tag{10}\\
& \mathrm{y}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \mathrm{ydm}  \tag{11}\\
& \mathrm{z}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \mathrm{zdm}  \tag{12}\\
& \mathrm{r}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \overline{\mathrm{r}} \mathrm{dm} \tag{13}
\end{align*}
$$

Ex: A system consists of three particles located as shown in figure below. Find the center of mass of the system. The masses of the particles are $m_{1}=m_{2}=1.0 \mathrm{~kg}$ and $m_{3}=2.0 \mathrm{~kg}$.

Soln:
$\mathrm{x}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}=1}^{3} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}=\frac{\mathrm{m}_{1} \mathrm{x}_{1}+\mathrm{m}_{2} \mathrm{x}_{2}+\mathrm{m}_{3} \mathrm{x}_{3}}{\mathrm{~m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}}$
$=\frac{(1 \mathrm{~kg})(1 \mathrm{~m})+(1 \mathrm{~kg})(2 \mathrm{~m})+(2 \mathrm{~kg})(0)}{(4 \mathrm{~kg})}=0.75 \mathrm{~m}$
$\mathrm{y}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}=1}^{3} \mathrm{~m}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}=\frac{\mathrm{m}_{1} \mathrm{y}_{1}+\mathrm{m}_{2} \mathrm{y}_{2}+\mathrm{m}_{3} \mathrm{y}_{3}}{\mathrm{~m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}}$
$=\frac{(1 \mathrm{~kg})(0)+(1 \mathrm{~kg})(0)+(2 \mathrm{~kg})(2 \mathrm{~m})}{(4 \mathrm{~kg})}=1 \mathrm{~m}$
$\overrightarrow{\mathrm{r}}_{\mathrm{CM}}=\mathrm{x}_{\mathrm{CM}} \hat{\mathrm{i}}+\mathrm{y}_{\mathrm{CM}} \hat{\mathrm{j}}=(0.75 \hat{\mathrm{i}}+\hat{\mathrm{j}}) \mathrm{m}$

Ex: (A) Show that the center of mass of a rod of mass $M$ and length L lies midway between its ends, assuming the rod has a uniform mass per unit length. (B) Suppose a rod is nonuniform such that its mass per unit length varies linearly with $x$ according to the expression $\lambda=\alpha \mathrm{x}$, where $\alpha$ is a constant. Find the x coordinate of the center of mass as a fraction of $L$.

Soln:
The mass per unit length (the linear mass density) can be written as $\lambda=\mathrm{M} / \mathrm{L}$ for the uniform rod. If the rod is divided into elements of length dx, the mass of each element is $\mathrm{dm}=\lambda \mathrm{dx}$.
(A) $\mathrm{x}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \mathrm{xdm}=\frac{1}{\mathrm{M}} \int_{0}^{\mathrm{L}} \mathrm{x} \lambda \mathrm{dx}=\left.\frac{\lambda}{\mathrm{M}} \frac{\mathrm{x}^{2}}{2}\right|_{0} ^{\mathrm{L}}=\frac{\lambda \mathrm{L}^{2}}{2 \mathrm{M}}$

Substitute $\lambda=M / L$
$\mathrm{x}_{\mathrm{CM}}=\frac{\mathrm{L}^{2}}{2 \mathrm{M}}\left(\frac{\mathrm{M}}{\mathrm{L}}\right)=\frac{1}{2} \mathrm{~L}$
(B) $\mathrm{x}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \int \mathrm{xdm}=\frac{1}{\mathrm{M}} \int_{0}^{\mathrm{L}} \mathrm{x} \lambda \mathrm{dx}=\frac{\alpha}{\mathrm{M}} \int_{0}^{\mathrm{L}} \mathrm{x}^{2} \mathrm{dx}==\left.\frac{\alpha}{\mathrm{M}} \frac{\mathrm{x}^{3}}{3}\right|_{0} ^{\mathrm{L}}=\frac{\alpha \mathrm{L}^{3}}{3 \mathrm{M}}$

Ex: Three particles of masses $m_{1}=1.2 \mathrm{~kg}, \mathrm{~m}_{2}=2.5 \mathrm{~kg}$, and $\mathrm{m}_{3}=3.4 \mathrm{~kg}$ form an equilateral triangle of edge length $\mathrm{a}=140 \mathrm{~cm}$. Where is the center of mass of this system?
Soln:
$\mathrm{x}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}=1}^{3} \mathrm{~m}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}=\frac{\mathrm{m}_{1} \mathrm{x}_{1}+\mathrm{m}_{2} \mathrm{x}_{2}+\mathrm{m}_{3} \mathrm{x}_{3}}{\mathrm{~m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}}$
$=\frac{(1.2 \mathrm{~kg})(0)+(2.5 \mathrm{~kg})(140 \mathrm{~cm})+(3.4 \mathrm{~kg})(70 \mathrm{~cm})}{(7.1 \mathrm{~kg})}=83 \mathrm{~cm}$
$\mathrm{y}_{\mathrm{CM}}=\frac{1}{\mathrm{M}} \sum_{\mathrm{i}=1}^{3} \mathrm{~m}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}=\frac{\mathrm{m}_{1} \mathrm{y}_{1}+\mathrm{m}_{2} \mathrm{y}_{2}+\mathrm{m}_{3} \mathrm{y}_{3}}{\mathrm{~m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}}$
$=\frac{(1.2 \mathrm{k} \mathrm{g})(0)+(2.5 \mathrm{~kg})(0 \mathrm{~cm})+(3.4 \mathrm{~kg})(120 \mathrm{~cm})}{(7.1 \mathrm{~kg})}=58 \mathrm{~cm}$

$\overrightarrow{\mathrm{r}}_{\mathrm{CM}}=\mathrm{x}_{\mathrm{CM}} \hat{\mathrm{i}}+\mathrm{y}_{\mathrm{CM}} \hat{\mathrm{j}}=(83 \hat{\mathrm{i}}+58 \hat{\mathrm{j}}) \mathrm{cm}$

Ex: You have been asked to hang a metal sign from a single vertical string. The sign has the triangular shape shown in figure below. The bottom of the sign is to be parallel to the ground. At what distance from the left end of the sign should you attach the support string?

Soln:
We assume the triangular sign has a uniform density and total mass M.
$\rho=$ density of the metal, $t=$ thickness of the metal sign

$$
\rightarrow \quad \mathrm{dm}=\rho y t d x \quad, \quad \rho=\frac{\mathrm{M}}{\mathrm{~V}}=\frac{\mathrm{dm}}{\mathrm{ytdx}}
$$

$\mathrm{V}=\frac{1}{2} \mathrm{abt}=$ volume of the triangle

$$
d m=\rho y t d x=\left(\frac{M}{\frac{1}{2} a b t}\right) y t d x=\frac{2 M y}{a b} d x
$$

$$
x_{\mathrm{CM}}=\frac{1}{M} \int x d m=\frac{1}{M} \int_{0}^{a} x \frac{2 M y}{a b} d x=\frac{2}{a b} \int_{0}^{a} x y d x
$$

$$
x_{\mathrm{CM}}=\frac{2}{a b} \int_{0}^{a} x\left(\frac{b}{a} x\right) d x=\frac{2}{a^{2}} \int_{0}^{a} x^{2} d x=\frac{2}{a^{2}}\left[\frac{x^{3}}{3}\right]_{0}^{a}=\frac{2}{3} a
$$

Ex: James (mass 90.0 kg ) and Ramon (mass 60.0 kg ) are 20.0 m apart on a frozen pond. Midway between them is a mug. They pull on the ends of a light rope stretched between them. When James has moved 6.0 m toward the mug, how far and in what direction has Ramon moved?

Soln:

$\mathrm{x}_{\mathrm{CM}}=\frac{\mathrm{m}_{1} \mathrm{x}_{1}+\mathrm{m}_{2} \mathrm{x}_{2}}{\mathrm{~m}_{1}+\mathrm{m}_{2}} \quad \rightarrow \quad \mathrm{x}_{\mathrm{CM}}=\frac{(90 \mathrm{~kg})(-10 \mathrm{~m})+(60 \mathrm{~kg})(10 \mathrm{~m})}{(90 \mathrm{~kg}+60 \mathrm{~kg})}=-2 \mathrm{~m}$
When James moves 6.0 m toward the mug, his new $x$-coordinate is -4 m . The center of mass doesn't move, so
$-2 \mathrm{~m}=\frac{(90 \mathrm{~kg})(-4 \mathrm{~m})+(60 \mathrm{~kg})\left(\mathrm{x}_{2}\right)}{(90 \mathrm{~kg}+60 \mathrm{~kg})} \quad \rightarrow \mathrm{x}_{2}=1 \mathrm{~m}$
